VORWORT

Mit vorliegendem Heft 71 wird die Veröffentlichung der seismischen Registrierungen der Nebenstationen von Jena für 1959, das Jahr der Internationalen Geophysikalischen Zusammenarbeit (CGI), fortgesetzt. Es sind dies die Stationen Potsdam, Halle, Plauen und Sonneberg.

Die Zusammenstellung des Heftes und die Bearbeitung der Seismogramme erfolgte durch die wissenschaftliche Assistentin Dipl.-Geophys. D. Gütth. Für die Station Halle wurde die Auswertung der Registrierungen von Fräulein Dr. habil. G. Richter übernommen.

W. Sponheuer

INHALTSVERZEICHNIS

| | |
|--|-----|
| Vorbemerkungen zur Auswertung der Seismogramme | 6 |
| Seismische Registrierungen 1959 von Potsdam | 7 |
| Seismische Registrierungen 1959 von Halle | 45 |
| Seismische Registrierungen 1959 von Plauen | 143 |
| Seismische Registrierungen 1959 von Sonneberg | 175 |

Vorbemerkungen zur Auswertung der Seismogramme

Für die vorliegende Bearbeitung wurde die international eingeführte Symbolik verwendet. Es bedeutet:

P, Pn = Normaler longitudinaler, direkter Vorläufer,

Pg = Individueller, longitudinaler Vorläufer nach Mohorovičić,

PKP, SKS = Direkte Kernwelle in großen Herdentfernungen,

PP, PPP = An der Oberfläche reflektierte Wellen mit gleichbleibendem Charakter,

pP und sP = In der Herdnähe an der Erdoberfläche reflektierte Wellen,

S, Sn, Sg = Transversale Vorläufer, wie oben,

SS, SSS = Reflektierte Transversalwellen mit gleichbleibendem Charakter,

PcP, PcS, ScS = Am Kern reflektierte Wellen mit gleichbleibendem oder wechselndem Charakter,

PS oder SP = Wechselwellen,

L = Beginn der Hauptphase,

G = Perioden größer als 40 s,

M_n = Maxima innerhalb der Hauptphase,

C = Periode der Nachläuferwellen,

F = Ende der Bebenregistrierung,

i = Scharfer Einsatz (impetus),

e = Auftauchen der Bewegung (emersio),

T = Periode der Bodenbewegung,

A = Amplitude in Mikron ($1 \mu\text{m} = 1/1000 \text{ mm}$), von der Nulllinie aus gerechnet,

Δ = Epizentralentfernung,

h = Herdtiefe,

Zeit = Mittlere Greenwich-Zeit, von Mitternacht zu Mitternacht gezählt,

USCGS = US Coast and Geodetic Survey, Washington,

BCIS = Bureau Central International de Séismologie.

Runde Klammern zeigen Unsicherheit in der Deutung der Phasen, Zeitangaben und Entfernung an.

D. G ü t h

Seismische Station Potsdam

Meereshöhe: 80 m

Länge: $\lambda = 13^{\circ}4,1' \text{ E}$

Untergrund: Sand (diluviale Ablagerungen)

Breite: $\varphi = 52^{\circ}22,8' \text{ N}$

Instrumente und Konstanten 1959

Zum Gedenken Emil Wiecherts anlässlich der 100. Wiederkehr seines Geburtstages

*(Veröffentlichungen des Instituts für Bodendynamik und Erdbebenforschung
in Jena der Deutschen Akademie der Wissenschaften zu Berlin, Heft 72)*

1962. 132 Seiten — 32 Abbildungen — 10 Karten — 8° — DM 29,—

Neben einem von Fr. Gerecke verfaßten Vorwort, das einen biographischen Abriß des großen Gelehrten enthält, und einem Verzeichnis von Wiecherts Schriften, zusammengestellt von J. Stelzner, sind einzelne Arbeiten aufgenommen.

In dem Artikel „Zur Seismizität von Deutschland“ von W. Sponheuer werden die derzeitigen Methoden zur Kennzeichnung der seismischen Aktivität angewandt und diese in Beziehung zur Tektonik gesetzt. Der Beitrag von Ullmann und Maaz befaßt sich mit einem neuartigen Verfahren zur Ortung von Erdbeben mittels Oberflächenwellen unter Verwendung von mindestens drei Stationen. In der Veröffentlichung von Chr. Teupser sind Eichkurven und Tabellen berechnet worden, um die bekannten Testversuche zur Bestimmung der Konstanten auch bei den elektrodynamischen Verrückungsmessern anwenden zu können. Weiterhin wird die Abstimmung und Eichung von Instrumenten mit großem Rückwirkungsfaktor behandelt. In der Untersuchung von H. Neundörfer wird festgestellt, ob ein Zusammenhang zwischen der Tageszeit und Stellung des Mondes mit Gebirgsschlägen in einem Senkungsgebiet besteht.

Tagungsbericht Geomagnetismus und Aeronomie

(Abhandlungen des Geomagnetischen Instituts Potsdam
der Deutschen Akademie der Wissenschaften zu Berlin, Nr. 29)

1962. 306 Seiten — 230 Abbildungen, davon 2 auf Falttafeln
22 Tabellen — 4° — DM 98,—

Im Juni 1960 fand ein Internationales Symposium „Geomagnetismus und Aeronomie“ in Berlin statt, das vom Geomagnetischen Institut der Deutschen Akademie der Wissenschaften abgehalten wurde, in Gemeinschaft mit dem Heinrich-Hertz-Institut für Schwingungsforschung der Deutschen Akademie der Wissenschaften zu Berlin und dem Observatorium für Ionosphärenforschung des Meteorologisch-Hydrologischen Dienstes der Deutschen Demokratischen Republik, Kühlungsborn.

Der Tagungsbericht enthält die zu den sieben Rahmenthemen geomagnetisches Ionenfeld, Radioastronomie, kosmische Strahlung, Sonneneruptionseffekte, Exosphäre und Magnetosphäre, Ionosphäre, Polarlicht gehaltenen 42 Vorträge, denen die neuesten Forschungsergebnisse der betreffenden Fachgebiete zugrunde liegen. In den zum größten Teil bisher noch unveröffentlichten Arbeiten werden u. a. die Ergebnisse des Internationalen Geophysikalischen Jahres ausgewertet.
