SEISMISCHE REGISTRERINGEN  
IN DE BILT.

---

4.

1916.

---

UTRECHT,  
KEMINK & ZOON,  
1918

## VORWORT.

---

In dieser vierten Nummer der Seismischen Registrierungen ist der Charakter der mikroseismischen Bewegung für jeden Tag des Jahres 1916 am Ende der Tabellen aufgenommen.

Besondere Aufmerksamkeit hat der Vorsteher der Seismischen Abteilung, Dr. G. VAN DIJK, den Bemerkungen gewidmet; die Seiten 89—100 enthalten eine Erweiterung dieser Bemerkungen für die ersten vier Bogen, unter Herbeiziehung aller verfügbaren Veröffentlichungen anderer seismischer Stationen. Am Schluß wird ein Vorschlag gemacht zur allgemeinen Empfehlung ähnlicher Arbeitsweisen, auf dem an anderer Stelle ausführlicher zurückgekommen werden soll.

*Der Hauptdirektor*  
*des Kgl. Niederl. Meteor. Instituts*  
DR. E. VAN EVERDINGEN.

DE BILT, Dezember 1918.

## EINLEITUNG.

---

Die geographischen Koordinaten der Station sind:

Breite  $52^{\circ} 6' N.$ ,

Länge  $5^{\circ} 11' E.$  von Greenwich.

Die Höhe des Terrains über dem Meeresniveau beträgt 3 m. Der Untergrund besteht aus Sand (diluvialen Ablagerungen).

Die folgenden Instrumente waren in Betrieb:

ein Paar Horizontalseismographen mit magnetischer Dämpfung und galvanometrischer Registrierung nach Fürst GALITZIN.

ein astatischer Horizontalseismograph nach WIECHERT,  $M = 200$  kg.

ein Paar Horizontalpendel von BOSCH,  $M = 25$  kg.

Die Zeitmarken wurden, wie vorher, von der Kontaktuhr VAN HUFFEL gegeben; dieselbe wurde anfangs zweimal wöchentlich kontrolliert durch telephonische Vergleichung mit der Zeit der Sternwarte in Utrecht; seit 21 September, nachdem die Erlaubnis hierzu erhalten worden war, alltäglich durch Vergleichung mit dem funkentelegraphischen Zeitsignal von 10<sup>h</sup> Greenwich vom Eiffelturm in Paris.

Die Temperatur im Instrumentenraum war am 1 Januar  $8^{\circ}.0$ , das Minimum war  $6^{\circ}.2$  am 13 und 14 März, das Maximum  $15^{\circ}.6$  von 16—20 August, während am Ende des Jahres, 31 Dezember, die Temperatur  $7^{\circ}.6$  betrug.

### DIE SEISMOGRAPHEN GALITZIN.

Abgesehen von kurzen Unterbrechungen wegen Konstantenbestimmungen, kleiner Reparaturen, u. s. w. registrierten die Seismographen GALITZIN regelmäßig.

**Die Empfindlichkeit der Seismographen.** Der Übertragungsfaktor  $k$  (die benutzten Zeichen sind dieselben wie in GALITZIN: Über ein neues aperiodisches Horizontalpendel) war, wie im vorigen Jahre, für die beiden Komponenten ungefähr = 17, die Entfernung des Galvanometerspiegels vom Registrierpapier etwa 135 bzw. 136 cm.

Bei den diesbezüglichen Bestimmungen wurde gefunden:

|  |                        |
|--|------------------------|
| Seism. 32 (N.S. Komp.)                         | Seism. 31 (E.W. Komp.) |
| Galvanometerperiode $T_1$ : 24.43 <sup>s</sup> | 24.96 <sup>s</sup>     |
| Reduzierte Pendellänge $l$ : 123.13 mm         | 122.58 mm.             |

Nachstehende Tabelle gibt die Werte der Vergrößerung für Perioden der Bodenbewegung  $T_p$  von 1—60 Sek., wenn:

Pendelperiode  $T =$  Galvanometerperiode  $T_1$ ,

Dämpfungs-konstante  $\mu^2 = 0$  (genau aperiodische Dämpfung),

Übertragungsfaktor  $k = 17$ ,

Entfernung der Trommel vom Galvanometerspiegel  $A_1 = 1350$  mm. beim Seism. 32, und = 1360 mm. beim. Seism. 31.

Obige Werte sind annähernd die mittleren Werte bei der Registrierung.

Der Ausdruck für die Vergrößerung  $\mathcal{V}$  wird, wenn  $T = T_1$ , und  $\mu^2 = 0$ , sehr einfach:

$$\mathcal{V} = \frac{T_p}{\frac{\pi l}{k A_1} \left\{ 1 + \left( \frac{T_p}{T} \right)^2 \right\}^2}$$

Aus der Tabelle geht hervor, daß die maximale Vergrößerung beider Komponenten (für  $T_p = 14$  à 15 Sek.: nl.  $\frac{1}{3} T \sqrt{3}$ ) etwas kleiner ist als 500.

Als Entfernung des Galvanometerspiegels vom Registrierpapier  $A_1$  ergab sich (das Galvanometer 32 wurde am 3 Mai etwas verstellt):

|              |           |                |           |          |
|--------------|-----------|----------------|-----------|----------|
| 27 Jan. 1915 | Seism. 32 | 1353 mm.       | Seism. 31 | 1359 mm. |
| 3 Mai 1916   | "         | 1355 bzw. 1348 | "         | 1361 "   |
| 21 Nov. "    | "         | 1350           | "         | 1359 "   |
| 28 Nov. 1917 | "         | 1351           | "         | 1359 "   |

Vergrößerungen  $\mathcal{V}$ , Seism. 32 (NS) und 31 (EW),

$T = T_1, \mu^2 = 0, \text{ u. s. w.}$

| $T_p$ | Seism. 32 (NS)<br>$T_1 = 24.43^s$ | Seism. 31 (EW)<br>$T_1 = 24.96^s$ | $T_p$ | Seism. 32 (NS)<br>$T_1 = 24.43^s$ | Seism. 31 (EW)<br>$T_1 = 24.43^s$ |
|-------|-----------------------------------|-----------------------------------|-------|-----------------------------------|-----------------------------------|
| s.    |                                   |                                   | s.    |                                   |                                   |
| 1     | 59                                | 60                                | 31    | 270                               | 288                               |

| 23    | 383                               | 403                               | 53    | 97                                | 105                               |
| 24    | 368                               | 389                               | 54    | 92                                | 100                               |
| 25    | 353                               | 374                               | 55    | 89                                | 96                                |
| 26    | 339                               | 359                               | 56    | 85                                | 92                                |
| 27    | 325                               | 344                               | 57    | 81                                | 89                                |
| 28    | 310                               | 330                               | 58    | 78                                | 85                                |
| 29    | 297                               | 315                               | 59    | 75                                | 82                                |
| 30    | 283                               | 301                               | 60    | 72                                | 78                                |

In der Tabelle S. VIII findet man die Ergebnisse der Konstantenbestimmungen; die kleineren Werte von  $k$  die bisweilen am Ende eines Intervalls gefunden werden, sind zum Teil aus der nicht genau symmetrischen Stellung des Pendels zwischen den Hufmagneten zu erklären. (Vgl. Einleitung 1914).

Die Zeiten der Maxima. Bekanntlich (Vgl. Einleitung 1915) trifft bei der Registrierung harmonischer Bodenbewegungen das Maximum in der Kurve später ein als die maximale Bodenbewegung. In der nachstehenden Tabelle (S. IX) sind, für  $T_p = 1-60$  Sek., die Werte der Zeitverspätung  $\tau + \tau_1$  bei den Seismographen 32 und 31 aufgenommen, wenn  $T = T_1$  und  $\mu^2 = 0$ ; bei der Bearbeitung der seismischen Registrierungen ist die Korrektur  $\tau + \tau_1$  an die auf den Diagrammen gemessenen Zeiten der Maxima angebracht.

Zeitverspätungen  $\tau + \tau_1$ , Seism. 32 (N.S.) und 31 (E.W.),

$$T = T_1, \mu^2 = 0.$$

| $T_p$ | Seism. 32 (NS)<br>$T_1 = 24.43^s$ | Seism. 31 (EW)<br>$T_1 = 24.96^s$ | $T_p$ | Seism. 32 (NS)<br>$T_1 = 24.43^s$ | Seism. 31 (EW)<br>$T_1 = 24.96^s$ |

## DIE SEISMOGRAPHEN WIECHERT UND BOSCH.

Die Seismographen WIECHERT und BOSCH registrierten, von kurzen Unterbrechungen abgesehen, regelmäßig. Die folgende Tabelle gibt die gefundenen Werte der Konstanten.

## Konstantenbestimmungen Wiechert und Bosch.

| Datum.                | T    | $\epsilon$ | V    | Datum.                | T    | $\epsilon$ | V    |
|-----------------------|------|------------|------|-----------------------|------|------------|------|
| Wiechert (N.S. Komp.) |      |            |      | Wiechert (E.W. Komp.) |      |            |      |
| 20 Aug. 1915          | 4.9  | 4          | 172  | 20 Aug. 1915          | 4.9  | 4          | 198  |
| 21 Febr. 1916         | 4.9  | 4          | 171  | 21 Febr. 1916         | 4.9  | 4          | 199  |
| 9 Aug. „              | 4.8  | 4          | 169  | 9 Aug. „              | 4.8  | 4          | 195  |
| 8, 9 Febr. 1917       | 5.0  | 4          | 171  | 8, 9 Febr. 1917       | 5.0  | 4          | 200  |
| Bosch A (N.S. Komp.)  |      |            |      | Bosch B (E.W. Komp.)  |      |            |      |
| 29 Juni 1915          | 17.3 | 4          | 20.1 | 29 Juni 1915          | 18.0 | 4          | 20.4 |
| 1 März 1916           | 18.2 | 4          | 20.4 | 1 März 1916           | 17.7 | 4          | 21.1 |
| 11 Aug. „             | 18.0 | 4          | 20.3 | 11 Aug. „             | 18.0 | 4          | 20.8 |
| 17 Febr. 1917         | 18.0 | 4          | 20.0 | 17 Febr. 1917         | 17.6 | 4          | 21.0 |

Bei den WIECHERT und BOSCH entnommenen Maxima wurde, wie auch an anderen Stationen üblich ist, die Korrektur  $\tau$  für die Zeitverspätung, die ohnehin sehr klein ist, nicht an die Zeit angebracht. Die Werte dieser Korrekturen findet man in Einleitung 1915, S XIII.

## BEARBEITUNG DER SEISMISCHEN REGISTRIERUNGEN.

Zu der Zusammenstellung der Tabellen haben die Diagramme der Seismographen GALITZIN gedient; wenn die Registrierungen der Seismographen WIECHERT oder BOSCH mitbenutzt wurden, ist dies in der Rubrik Bemerkungen mitgeteilt worden.

Die folgenden Zeichen wurden angewandt:

P = undae primae = erste Vorläufer.

PRn = n. mal an der Erdoberfläche reflektierte erste Vorläufer.

S = undae secundae = zweite Vorläufer.

SRn = n. mal an der Erdoberfläche reflektierte zweite Vorläufer.

PS = Wechselwellen.

m = undae maximae = Maxima von Wellen in der Vorphase.

L = undae longae = lange Wellen.

M = Maxima der Bodenbewegung im Hauptbeben.

M' = Maxima von Oberflächenwellen, die die Station über den Gegenpunkt erreichen.

M'' = Maxima von Oberflächenwellen, die über Station, Gegenpunkt und Herd die Station zum zweiten Mal erreichen.

F = finis = Ende der sichtbaren Bewegung.

i = impetus = scharfes Auftreten einer Phase.

e = emersio = allmähliches Auftreten einer Phase.

AN = Amplitude der NS. Komponente der wahren Bodenbewegung in  $\mu$ , gerechnet von der Ruhelinie aus.

AE = Amplitude der EW. Komponente der wahren Bodenbewegung in  $\mu$ , gerechnet von der Ruhelinie aus.

$\mu$  = Mikron =  $\frac{1}{1000}$  mm.

$\Delta$  = Epizentralentfernung in Kilometern.

O = Zeit des Bebens im Epizentrum.

$\lambda$  = geographische Länge des Epizentrums.

$\phi$  = geographische Breite des Epizentrums.

Die Zeit ist in mittlerer Greenwicher Zeit, von Mitternacht bis Mitternacht, gezählt von 0 bis 23h, angegeben. Die Periode gibt die Dauer einer Doppelschwingung in Sekunden an.

Wenn eine Größe fraglich war, wurde dieselbe in Klammern gesetzt oder mit einem ? versehen. Hinzufügung eines N oder E hinter ein Zeichen bedeutet, daß dasselbe sich auf die NS. bzw. EW. Komponente der Bodenbewegung bezieht, + bezeichnet eine Abweichung nach N oder E, — nach S oder W.

Zur Berechnung von  $\Delta$  und O wurden benutzt: Seismological Tables by OTTO KLOTZ, D.Sc., F.R.A.S. (Publications of the Dominion Observatory, Vol. III, N<sup>o</sup>. 2. Ottawa 1916) von denen die Tabelle für S—P von ZEISSIG, Jugenheim, abgeleitet ist aus den Berechnungen von WIECHERT und ZOEPPRITZ, während die für P—O von Dr. A. MOHOROVICIC, Agram, herrührt. Die Werte in letzterer Tabelle weichen im allgemeinen um einige Sekunden ab von der Tabelle „Verbesserte Laufzeitkurve für die Longitudinalwellen“ von HECKER in „Mitteilungen des Zentralbureaus der Intern. Seismolog. Assoziation, II, 1915, S. 16.

## BESTIMMUNG DER HERDE.

Die in der Rubrik Bemerkungen angegebenen Herde sind außer aus den eigenen Registrierungen oder Zeitungsnachrichten, mit Hilfe der dem Institute zugegangenen Monats- oder Jahresberichte seismischer Stationen abgeleitet oder denselben entnommen. Von vielen Stationen standen die Berichte von nur einem Teil des Jahres zur Verfügung, u. a. dadurch daß der Versand der Veröffentlichungen einiger Stationen einstweilen eingestellt worden ist. Mehrere Berichte trafen ein, nachdem mit der Bearbeitung der Seismogramme schon begonnen war.

Die folgenden Berichte wurden benutzt:

Earthquake Bulletin of the Meteorological Office Observatories. Eskdalemuir (April—August),

Observations séismographiques faites à l'observatoire météorologique d'Upsala de septembre 1912 à avril 1917,

Königstuhl-Sternwarte Heidelberg, Erdbebenbericht (Januar—September),

Straßburg i/E., Seismische Aufzeichnungen der Kaiserl. Hauptstation für Erdbebenforschung,

Bulletin Mensuel du Bureau Central Météorologique de France, Bulletin sismologique (Parc-Saint Maur, Marseille),

Bollettino Meteorologico e Geodinamico, Moncalieri,

Macrosismi avvertiti in Italia nell' anno 1916 (in Bollettino della Società sismologica Italiana, Vol. XX, 1916, N<sup>o</sup>. 5—6),

Vorläufiger Bericht über Erdbebenmeldungen in Österreich (in Anzeiger, 1916, 1917. Kaiserliche Akademie der Wissenschaften in Wien, mathematisch-naturwissenschaftliche Klasse),

Berichte über seismische Aufzeichnungen, Zagreb (= Agram, Kroatien),

Jahrbuch der meteorologischen, erdmagnetischen und seismischen Beobachtungen in Pola, III. Seismische Beobachtungen,

Zehnter Bericht über seismische Registrierungen in Graz,

Athènes, Bulletin sismique de l'Observatoire National,

Barcelona, Estación sísmica del Observatorio Fabra,

San Fernando, Boletín sísmico del Instituto y Observatorio de Marina,

Observações meteorológicas, magnéticas e sísmicas feitas no Observatório meteorológico di Coimbra,

Observatoire d'Alger-Bouzaréah, Bulletin sismique,

Royal Alfred Observatory, Mauritius, Results of magnetical, meteorological and seismological observations,

Government of India, Meteorological Department, Monthly Weather Review (Kodaikanal, Bombay, Calcutta, Simla, Januar—August),

Seismological Bulletin, Batavia Observatory, Java,

The Government of the Philippine Islands Weather Bureau, Manila Central Observatory, Seismological Bulletin (Januar—Juni),

Catalogue of Philippine Earthquakes 1916 (Reprint from the Weather Bulletin for December 1916),

Annual Report, Part II, Seismological Observations in Ôsaka,

Annual Report of the meteorological and the seismological observations made at Mizusawa,

Ottawa, Earthquake Station, Dominion Astronomical Observatory,

U. S. Department of Agriculture, Monthly Weather Review, Section V, Seismology (Washington, Cambridge, etc., Januar—Juli),

Boletín Mensual del Observatorio Meteorologico y Seismologico Central de Mexico, Tacubaya D. F.,

La Paz (Bolivia), Boletín sísmico del Observatorio del Colegio San Calixto,

República Argentina, Oficina Meteorologica Nacional, Boletín Mensual (Pilar, Mendoza, Andalgala).

Während oder nach der Drucklegung der Tabellen trafen ein:

Report of the Director of the Liverpool Observatory Bidston, Birkenhead,

Annual Report of the Meteorological Observatory of the Government General of Chosen, Seismic Bulletin Jinsen (Chemulpo, Korea),

Results of observations made at the United States Coast and

Geodetic Survey, Magnetic observatory at Sitka (Alaska) and near Honolulu, Hawaii, 1915 and 1916, und

Location of Epicentres for 1916 by ERNEST A HODGSON, M. A., Dominion Observatory, Ottawa.

Von allen registrierten Beben wurde versucht den Herd zu bestimmen unter Berücksichtigung der Berichte anderer seismischen Stationen; die Fälle, wo es möglich ist den Herd genau aus den Beobachtungen einer einzigen Station (aus Azimut und Entfernung) abzuleiten, sind verhältnismäßig selten. Besonders bei schwachen Fernbeben kam es vor daß ein Beben nicht in den Berichten der anderen Stationen zurückgefunden wurde; in diesen Fällen, und auch wenn es sehr zweifelhaft erschien, daß eine anderswo ungefähr um dieselbe Zeit erwähnte Registrierung sich auf dasselbe Beben bezog als die hiesige, wurde in der Rubrik Bemerkungen nichts mitgeteilt. Wo ein Beben an mehreren Observatorien registriert wurde, die Angaben jedoch nicht genügten den Herd zu bestimmen, sind unter Bemerkungen einige Daten einiger dieser, meistens dem Herde näher liegenden, Stationen aufgenommen; wenn noch Zweifel übrig blieb mit einem? versehen. Wenn mittels der zur Verfügung stehenden Daten eine Herdbestimmung möglich war (z. B. wenn die Herdentfernung von 3 oder mehr Stationen bekannt war aus P und S, und die daraus berechneten O für die verschiedenen Stationen gut übereinstimmten, oder die Herddistanzen von 2 Stationen bekannt waren, nebst anderen Angaben anderer Stationen), so wurde das Ergebnis unter Bemerkungen mitgeteilt.

Nach den Tabellen sind noch einige Seiten Bemerkungen aufgenommen, die eine Erweiterung der S. 1—64 gemachten Bemerkungen bilden und kurzgefaßt die Angaben enthalten, die für die Herdbestimmung von Wichtigkeit sind. Es wurden darin u. a. Listen mit  $\Delta$  und O der Stationen und viele Zeitangaben aufgenommen; Stationen deren  $\Delta$  und O bedeutend abwichen, wohl infolge irriger Deutung der Phasen (z. B. bei fernen Fernbeben P statt PR oder S, S statt SR u. s. w.) wurden fortgelassen.

So viel wie möglich hat man die Angaben der makroseismischen Kataloge (z. B. Philippinen, Britisch-Indien, Italien u. s. w.) und die in den Erdbebenberichten vorkommenden Herdangaben benutzt. Es

muß aber bemerkt werden, daß letztere Angaben verschiedener Stationen nicht immer mit einander in Einklang sind, und es daher nötig war diese Mitteilungen näher zu prüfen.

Die Berichte einiger Observatorien haben vorzügliche Dienste bei den Herdbestimmungen geleistet, von anderen konnte man hingegen nur wenig Nutzen ziehen; dies hängt, außer mit der Lage der Stationen, größtenteils zusammen mit der Empfindlichkeit und Genauigkeit der Seismographen und mit der Weise, in der die Registrierungen bearbeitet und veröffentlicht werden.

Zur Berechnung von  $\Delta$  und O benutzen fast alle Stationen die Tabellen von WIECHERT—ZOEPPRITZ—ZEISSIG für S—P und von Dr. A. MOHOROVICIC für P—O; ein paar Stationen wenden offenbar eine andere Ableitung an, ohne jedoch dieselbe in ihren Berichten zu erwähnen. Bei den hier unter Bemerkungen eingetragenen Listen sind, um der Homogenität willen, obige Tabellen stets angewandt. Wenn mehrere Werte von P oder S (z. B. eP, iP, PN, PE u. s. w.) in den Berichten angegeben waren, so wurden stets die ersten Zeiten genommen; es können daher die hiesigen Angaben von  $\Delta$  und O etwas von den in den Berichten selbst gegebenen Daten abweichen.

Die Herdbestimmungen von HODGSON in Location of Epicentres, Ottawa, die verkürzt unter den Bemerkungen aufgenommen sind, und die von De Bilt stimmen, wie sich erwarten ließ, im allgemeinen gut mit einander überein; wenn größere Abweichungen vorliegen kommt dies besonders dadurch, daß nicht dieselben Stationen zur Herdbestimmung dienten und nur eine beschränkte Anzahl von Angaben zur Verfügung stand.

Die endgültige Bearbeitung der Seismogramme in De Bilt geschieht geraume Zeit nach der Registrierung; so wurde Anfang 1918 mit den Erdbebendiagrammen des Jahres 1916 begonnen. Dieses Verfahren wird gefolgt um mit Hilfe der inzwischen eingetroffenen Erdbebenberichte anderer Stationen mit besserem Erfolge die Registrierungen analysieren und die Bebenherde bestimmen zu können. Es war dabei die Absicht die Berichte von mit empfindlichen Seismographen ausgestatteten Stationen aus verschiedenen Teilen der Erde zu benutzen. Die Zeitumstände sind diesem Bestreben nicht günstig gewesen, mehrere Stationen wurden gebeten Ihre Berichte einzusenden, von nur

wenigen jedoch wurden dieselben empfangen, indem überdies der Versand der Veröffentlichungen einiger Stationen eingestellt wurde.

Wenn mehrere, vorzugsweise regelmäßig über die Erde verteilte und mit empfindlichen Instrumenten ausgestatteten seismischen Stationen sich der in De Bilt gefolgten Bearbeitungsweise der Erdbebenregistrierungen anschließen wollten, andere, ebenfalls regelmäßig verteilte Stationen eine möglichst genaue vorläufige Bearbeitung sobald wie möglich publizieren würden, so wäre es möglich in kurzer Zeit, eher als es jetzt der Fall ist, eine gute Übersicht aller registrierten Erdbeben zu bekommen.

| Datum<br>1916 | Phase | Zeit |        |      | Periode<br>s | Amplitude      |                | Bemerkungen |  |

Herd: 540 K.M. von La Paz;  
Herd: wie 268(?).  
(Nach Loc. of Epic. Ottawa:  
 $\phi = 22^{\circ}$  S,  $\lambda = 71^{\circ}$  W.  
Angenähert.)

In Luzon (Philippinen) gefühlt,  
Herd bei der N.E.-Küste von Luzon?

Herd unweit der S.E.-Küste von  
Kiu-Shiu, Japan.

In Mizusawa gefühlt. Herd unweit  
der E.-Küste von Honshu, Japan.  
(Nach Loc. of Epic. Ottawa:  
 $\phi = 38^{\circ}$  N,  $\lambda = 141^{\circ}.5$  E.  
O = 22<sup>h</sup> 42<sup>m</sup> 36<sup>s</sup>).

BEMERKUNGEN.

Die folgenden bilden eine Erweiterung der in den vorstehenden Tabellen aufgenommenen Bemerkungen. Sie enthalten u. a. Angaben, den Veröffentlichungen seismischer Stationen, nach der Bearbeitung der Seismogramme und während oder nach der Drucklegung der Tabellen eingetroffen, entnommen, und weiter viele Zeitangaben; sie geben kurzgefaßt die Daten, welche zur Bestimmung der Herde von Wichtigkeit sind. Von den besser ausgeprägten seismischen Störungen sind Listen mit  $\Delta$  und O, berechnet aus den Angaben seismischer Stationen, eingetragen; Werte, die bedeutend abwichen, sind fortgelassen. Von den Beben, deren Herd nicht aus den zur Verfügung stehenden Daten zu bestimmen war, sind vielfach einige Angaben von dem Herde näher liegenden Stationen aufgenommen. Diese Bemerkungen beziehen sich auf die Seiten 1—64, die Bemerkungen in den Tabellen von S. 65—87 wurden schon in derselben Weise wie die nachstehenden zusammengestellt.

## DIE MIKROSEISMISCHE BEWEGUNG.

Die nachstehende Tabelle, die den Charakter der mikroseismischen Bewegung angibt, ist in derselben Weise zusammengestellt wie für die vorigen Jahre (vgl. 1915, S. 101). Es bedeutet: 0 sehr schwach und schwach, 1 mäßig, 2 stark und 3 sehr stark. Die Daten sind den Registrierungen des Seismographen WIECHERT entnommen, die Amplituden des Diagrammes (von der Ruhelinie aus gemessen) und die angenäherten Amplituden der Bodenbewegung die den Klassen 0, 1, 2 und 3 entsprechen, sind unten zusammengefaßt.

| Klasse. | Ampl. Diagramm.      | Ampl. Bodenbewegung.    |
|---------|----------------------|-------------------------|
| 0       | 0— $\frac{1}{4}$ mm. | 0— $1\frac{1}{4}$ $\mu$ |
| 1       | $\frac{1}{4}$ —1 „   | $1\frac{1}{4}$ —5 „     |
| 2       | 1—2 „                | 5—10 „                  |
| 3       | > 2 „                | > 10 „                  |

Der Charakter eines Tages wird durch eine Ziffer angegeben, wenn die mikroseismische Bewegung den ganzen Tag (0—24<sup>h</sup> Grw.) innerhalb der Grenzen einer Klasse geblieben ist; durch zwei Ziffern, wenn sie im Laufe des Tages von einer Klasse in eine andere übergeht, die erste Ziffer bezieht sich auf den ersten Teil (nach 0<sup>h</sup>), die zweite auf den letzten Teil (vor 24<sup>h</sup>) eines Tages; durch drei Ziffern, wenn die mikroseismische Bewegung im Laufe des Tages erst zugenommen, dann abgenommen hat (wie z. B. bei einem mikroseismischen Sturme), oder umgekehrt, und dabei die Grenzen der Klassen überschritten hat; die mittlere Ziffer bezieht sich auf den Mittelteil des Tages.

Charakter der mikroseismischen Bewegung.
