## INTRODUCTION.

The form of our Monthly Bulletin as adopted in 1907 and modified in 1914 will be retained. Unless otherwise stated, by daily rainfall in the Philippines we mean the amount of rainfall for 24 hours beginning 6 a. m. The time used is that of the one hundred and twentieth meridian east of Greenwich.

The following is a list of all the meteorological stations of the Weather Bureau together with the names of the respective observers, who are in a great measure responsible for the accuracy of the observations published in this Bulletin:

**SECONDARY STATIONS AND OBSERVERS OF THE WEATHER BUREAU.**

Station.	North latitude.	East longitude.	Observer.	Class.
Jolo	6 03	121 00	Meliton Cedeño	III
Isabela, Basilan	6 42	121 58	Inocencio Rodriguez	IV
Zamboanga	6 54	122 05	Juan Lugod	II
Davao	7 01	125 35	Lamberto Garcia	III

## INTRODUCTION.

The signs and symbols employed in this publication are the following:

Symbol.	Equal to—	Symbol.	Equal to—
Ci.	Cirrus.	o	Overcast.
Ci.-S.	Cirro-stratus.	p	Passing showers of rain.
Ci.-Cu.	Cirro-cumulus.	q	Squally weather.
A.-Cu.	Alto-cumulus.	u	Ugly or threatening.
A.-S.	Alto-stratus.	v	Visibility of distant objects.
S.-Cu.	Strato-cumulus.	w	Wet or heavy dew.
N.	Nimbus.	●	Rain.
Cu.	Cumulus.	≡	Fog or mist.
Cu.-N.	Cumulo-nimbus.	⊕	Dew.
S.	Stratus.	⊖	Solar halo.
Fr.-Cu.	Fracto-cumulus.	⊖	Lunar halo.
Fr.-N.	Fracto-nimbus.	⊖	Lunar corona.
Fr.-S.	Fracto-stratus.	⊖	Solar corona.
S.-cf.	Stratus-cumuliformis.	⊖	Heat lightning.
N.-cf.	Nimbus-cumuliformis.	⊖	Thunderstorm.
M.-Cu.	Mammato-cumulus.	⊖	Thunder without lightning.
b	Bright, clear sky.	⊖	Strong wind.
c	Cloudy weather.	⊖	Rainbow.
d	Drizzling, light rain.	⊖	Dry mist.
g	Gloomy or stormy-looking weather.	⊖	

NOTE.—A small ' or ' used as an exponent to the above symbols indicates, respectively, that the intensity of the meteor denoted by the symbols thus affected was small or very great.

## INTRODUCCIÓN.

Conservaremos en esta publicación la misma forma adoptada en 1907, y modificada en 1914. Mientras no se diga lo contrario, por lluvia diaria en Filipinas entendemos la cantidad de lluvia en 24 horas empezando a 6 a. m. El tiempo usado es el del meridiano ciento veinte E de Greenwich.

Damos en el texto inglés una lista de todas nuestras estaciones con los nombres respectivos de los observadores, los cuales son en gran parte responsables de las observaciones que se publican en estos boletines.

Los signos y símbolos usados en esta publicación son los siguientes:

Símbolos.	Significado.	Símbolos.	Significado.
Ci.	Cirrus.	o	Cubierto.
Ci.-S.	Cirro-stratus	p	Lluvia pasajera.
Ci.-Cu.	Cirro-cumulus.	q	Achubascado.
A.-Cu.	Alto-cumulus.	u	Tiempo feo o amenazador.
A.-S.	Alto-stratus.	v	Trasparencia del aire.
S.-Cu.	Strato-cumulus.	w	Húmedo.
N.	Nimbus.	●	Lluvia.
Cu.	Cumulus.	≡	Niebla o neblina.
Cu.-N.	Cumulo-nimbus.	⊕	Rocío.
S.	Stratus.	⊕	Halo solar.
Fr.-Cu.	Fracto-cumulus.	⊖	Halo lunar.
Fr.-N.	Fracto-nimbus.	⊖	Corona lunar.
Fr.-S.	Fracto-stratus.	⊖	Corona solar.
S.-cf.	Stratus-cumuliformis.	↖ ↗ ↘ ↙	Relámpago sin trueno.
N.-cf.	Nimbus-cumuliformis.	↖ ↗ ↘ ↙	Tempestad de trueno.
M.-Cu.	Mammato-cumulus.	↖ ↗ ↘ ↙	Trueno sin relámpago.
b	Despejado.	↖ ↗ ↘ ↙	Viento duro.
c	Nublado.	↖ ↗ ↘ ↙	Arco-iris.
d	Llovizna o lluvia ligera.	↖ ↗ ↘ ↙	Niebla seca.
g	Mal cariz; tiempo cerrado, fosco.	↖ ↗ ↘ ↙	

NOTA.—Unº o un² puestos como exponentes de los signos, indican respectivamente una muy débil o una muy fuerte intensidad en el meteoro que representan.

# METEOROLOGICAL BULLETIN FOR JANUARY, 1919.

By REV. JOSE CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure of this month in the Philippines is slightly to moderately higher than that of the preceding year and than the normal for January. The highest pressures were observed either on the 6th or on the 19th, while the lowest pressures were recorded on the 11th.

The mean monthly temperature differs very slightly from the normal, although it is slightly to moderately higher than that of January, 1918. The absolute maximum and minimum temperatures for Manila were 32.7° C. on the 26th, and 16.3° C. on the 24th. The extreme temperatures for Baguio were 25.4° C., 11.2° C. on the top of Miarodar, and 25.9° C., 7.9° C. in the valley.

<sup>a</sup> 30 days of observation.

<sup>b</sup> 25 days of observation.

<sup>c</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—With only two exceptions, all the stations of the Philippines reported a monthly rainfall below the normal, the differences being particularly great for the stations on the eastern part of the Archipelago. In Manila there were no more than 6.6 mm. of water collected in the rain-gauges during the month, this amount being 19.5 mm. below the normal of January. The total monthly rainfall for Baguio is 2.5 mm., and differs from the normal by — 28.3 mm.

## DEPRESSIONS AND TYPHOONS.

There were no depression or typhoon near the Philippines during this month. Even in the whole Far East there was none worth mentioning, except on the 10th to 12th when a depression moved eastward from the Eastern Sea; but this should rather be considered as a continental depression.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes en Filipinas es ligera o moderadamente mayor que la del año pasado y que la normal de enero. Las presiones más altas se observaron el día 6 ó el 19, al paso que las más bajas se registraron el 11.

La temperatura media mensual difiere muy ligeramente de la normal, aunque es ligera o moderadamente mayor que la de enero de 1918. Las temperaturas máxima y mínima absolutas de Manila fueron  $32.7^{\circ}$  C. y  $16.3^{\circ}$  C. registradas los días 26 y 24, respectivamente. Las temperaturas extremas de Baguio fueron  $25.4^{\circ}$  C.,  $11.2^{\circ}$  C. en la cumbre del Mirador, y  $25.9^{\circ}$  C.,  $7.9^{\circ}$  C. en el valle.

**Precipitación acuosa.**—Con solas dos excepciones, todas las estaciones de Filipinas registraron una lluvia mensual menor que la normal, siendo las diferencias particularmente grandes en las estaciones de la parte oriental del Archipiélago. En Manila no se recogieron en los pluviómetros más de 6.6 mm. de agua durante el mes, cantidad que difiere de la normal de enero en —19.5 mm. La lluvia total del mes en Baguio es 2.5 mm., menor que la normal en 28.3 mm.

## DEPRESIONES Y TIFONES.

Durante este mes no hubo depresión o tifón cerca de Filipinas. Aun en todo el Extremo Oriente ninguna hubo en todo el mes que merezca mencionarse, excepto del 10 al 12 en que una depresión se movió hacia el E desde el Mar del Este; pero esta debería considerarse más bien como una depresión continental.

\* All the mean values given in this table are deduced from six daily observations taken at 2, 6, 10 a. m. and 2, 6, 10 p. m.

<sup>b</sup> The barometric readings of this station are not reduced to sea level.

<sup>c</sup> Maximum of hourly observations taken from 6 a. m. to 6 p. m.

<sup>d</sup> This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

<sup>e</sup> 2 hours missing.

<sup>f</sup> 1 hour missing.

## SEISMOLOGICAL BULLETIN FOR JANUARY, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

1, 1<sup>h</sup> 36<sup>m</sup> 24<sup>s\*</sup> [1, 9<sup>h</sup> 36<sup>m</sup> 24<sup>s</sup>]. E. Mindanao. Earthquake of intensity VII. It was very extensive, shaking the whole Island of Mindanao and the Visayan, Samar, Leyte, Cebu and Bohol. The intensity with which it was felt at Butuan and other towns of the northern portion of the Agusan Valley indicates that the epicenter lay either within the valley or near to the Pacific coast at about 9° latitude N. There followed four strong aftershocks of intensity III-IV during the next two hours. It was registered all over the world.

At 6<sup>h</sup> 2<sup>m</sup> 31<sup>s\*</sup> [14<sup>h</sup> 2<sup>m</sup> 31<sup>s</sup>] occurred a second earthquake of intensity IV-V but of less extension: its origin apparently was located at a greater distance from Butuan and Manila. It was registered at Taihoku, Formosa.

The seismograph of the former station recorded thirty-two shocks during this day; the first occurred at 3<sup>h</sup> 46<sup>m</sup> (Insular Time) and was in correspondence with earthquake shocks felt at Davao, some 200 kilometers south of Butuan.

2, 22<sup>h</sup> 26<sup>m</sup> 56<sup>s\*</sup> [3, 6<sup>h</sup> 26<sup>m</sup> 56<sup>s</sup>]. Butuan (N Mindanao). Earthquake of intensity II-III of distant origin, likely in the Ocean.

4, 2<sup>h</sup> 35<sup>m</sup> 24<sup>s\*</sup> [4, 10<sup>h</sup> 35<sup>m</sup> 24<sup>s</sup>]. NE Mindanao. Earthquake of intensity IV, felt through the provinces of Surigao and Agusan. It apparently originated not far from the place of origin of the one felt on the first. It repeated with intensity III-IV at 14<sup>h</sup> 20<sup>m</sup> 18<sup>s\*</sup> [22<sup>h</sup> 20<sup>m</sup> 18<sup>s</sup>].

5, 14<sup>h</sup> 20<sup>m</sup> [5, 22<sup>h</sup> 20<sup>m</sup>]. Davao (SE Mindanao). Oscillatory earthquake, intensity II-III.

9, 0<sup>h</sup> 10<sup>m</sup> [9, 8<sup>h</sup> 10<sup>m</sup>]. Ambos Camarines (SE Luzon). Earthquake of intensity III, in the Isarog region.

13, 12<sup>h</sup> 0<sup>m</sup> 52<sup>s\*</sup> [13, 20<sup>h</sup> 0<sup>m</sup> 52<sup>s</sup>]. Davao (SE Mindanao). Oscillatory earthquake of intensity IV, duration 30 seconds.

15, 7<sup>h</sup> 30<sup>m</sup> [15, 15<sup>h</sup> 30<sup>m</sup>]. Davao (SE Mindanao). Earthquake of intensity III.

15, 13<sup>h</sup> 28<sup>m</sup> [15, 21<sup>h</sup> 28<sup>m</sup>]. Iloilo (SE Panay). Earthquake shocks of intensity III.

25, 11<sup>h</sup> 22<sup>m</sup> [25, 19<sup>h</sup> 22<sup>m</sup>]. Butuan (N Mindanao). Oscillatory earthquake, direction N-S, intensity IV, duration 5 seconds.

29, 18<sup>h</sup> 48<sup>m</sup> [30, 2<sup>h</sup> 48<sup>m</sup>]. Ormoc (W Leyte). Earthquake of intensity VI, duration 15 seconds. It repeated at 20<sup>h</sup> 6<sup>m</sup> [30, 4<sup>h</sup> 6<sup>m</sup>] with intensity III. Origin under the sea, some distance from the west coast where exists a local and shallow center.

30, 11<sup>h</sup> 29<sup>m</sup> [30, 19<sup>h</sup> 29<sup>m</sup>]. Butuan (N Mindanao). Oscillatory earthquake of intensity III, duration 10 seconds.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

## RECORDS OF THE MICROSEISMOGRAPH.

[Time: Greenwich mean. Midnight=0h. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.62, \epsilon=2.726, \frac{r}{T_0^2}=0.021;$   
 $A_E: T_0=6.03, \epsilon=2.378, \frac{r}{T_0^2}=0.037.$  Alluvium. 2.40 meters above sea level.]

TEMBOLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

1, 1<sup>h</sup> 36<sup>m</sup> 24<sup>s\*</sup> [1, 9<sup>h</sup> 36<sup>m</sup> 24<sup>s</sup>]. E de Mindanao. Temblor de tierra de intensidad VII. Tuvo grande extensión, sintiéndose en toda la Isla de Mindanao y en las Islas de Leyte, Sámar, Cebu y Bohol. A juzgar por su grande intensidad en Butúan y los demás pueblos de la parte norte del Valle del Agusan su origen se hallaba en dicho valle o tal vez en el Pacífico, muy cerca de la costa hacia los 9° N. Siguiéronse cuatro repeticiones de intensidad III-IV durante las dos horas siguientes. Fué registrado en todo el mundo.

A 6<sup>h</sup> 2<sup>m</sup> 31<sup>s\*</sup> [14<sup>h</sup> 2<sup>m</sup> 31<sup>s</sup>] ocurrió un segundo temblor de intensidad IV-V pero de poca extensión, cuyo origen se hallaba algo más lejos de Manila y de Butúan. Fué registrado en Taihoku, Formosa.

El sismógrafo Wiechert de esta estación registró treinta y dos pequeños choques durante este día. El primero ocurrió a 3<sup>h</sup> 46<sup>m</sup> de la madrugada y correspondía a un temblor perceptible en Dávao cerca de 200 kilómetros distante al sur de Butúan.

2, 22<sup>h</sup> 26<sup>m</sup> 56<sup>s\*</sup> [3, 6<sup>h</sup> 26<sup>m</sup> 56<sup>s</sup>]. Butúan (N de Mindanao). Temblor de tierra de intensidad II-III, de origen lejano, probablemente en el Pacífico.

4, 2<sup>h</sup> 35<sup>m</sup> 24<sup>s\*</sup> [4, 10<sup>h</sup> 35<sup>m</sup> 24<sup>s</sup>]. NE de Mindanao. Temblor de tierra de intensidad IV sentido en las Provincias de Surigao y Agusan. Su origen se hallaba al parecer cerca del sitio del terremoto del día 1.<sup>o</sup>. Repitió a 14<sup>h</sup> 20<sup>m</sup> 18<sup>s\*</sup> [22<sup>h</sup> 20<sup>m</sup> 18<sup>s</sup>] con intensidad III-IV.

5, 14<sup>h</sup> 20<sup>m</sup> [5, 22<sup>h</sup> 20<sup>m</sup>]. Dávao (SE de Mindanao). Temblor oscilatorio de intensidad II-III.

9, 0<sup>h</sup> 10<sup>m</sup> [9, 8<sup>h</sup> 10<sup>m</sup>]. Ambos Camarines (SE de Luzón). Temblor de tierra de intensidad III en la región del Isarog.

13, 12<sup>h</sup> 0<sup>m</sup> 52<sup>s\*</sup> [13, 20<sup>h</sup> 0<sup>m</sup> 52<sup>s</sup>]. Dávao (SE de Mindanao). Temblor oscilatorio de intensidad IV, duración 30 segundos.

15, 7<sup>h</sup> 30<sup>m</sup> [15, 15<sup>h</sup> 30<sup>m</sup>]. Dávao (SE de Mindanao). Temblor de tierra de intensidad III.

15, 13<sup>h</sup> 28<sup>m</sup> [15, 21<sup>h</sup> 28<sup>m</sup>]. Iloílo (SE de Panay). Temblor de tierra de intensidad III.

25, 11<sup>h</sup> 22<sup>m</sup> [25, 19<sup>h</sup> 22<sup>m</sup>]. Butúan (N de Mindanao). Temblor oscilatorio, dirección N-S, intensidad IV, duración 5 segundos.

29, 18<sup>h</sup> 48<sup>m</sup> [30, 2<sup>h</sup> 48<sup>m</sup>]. Ormoc (W de Leyte). Temblor de tierra de intensidad VI, duración 15 segundos. Repitió a 20<sup>h</sup> 6<sup>m</sup> [30, 4<sup>h</sup> 6<sup>m</sup>] con intensidad III. Origen probable en el mar al W, donde existe un centro superficial o de hundimiento.

30, 11<sup>h</sup> 29<sup>m</sup> [30, 19<sup>h</sup> 29<sup>m</sup>]. Butúan (N de Mindanao). Temblor oscilatorio de intensidad III, duración 10 segundos.

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forcl. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

## RECENT ERUPTIONS OF THE BULUSAN VOLCANO, 1916 AND 1918.

The Bulusan Volcano is the most oriental of Luzon Island, rising on its southeast end, close to "San Bernardino Strait" which separates Luzon from Samar Island. Its approximate geographical position is  $12^{\circ} 47' N$ ,  $124^{\circ} 4' E$  and it rises to a height of about 1,500 meters.

No historic records are to be found of any important eruption: for centuries it has been seen as dormant, only at times issuing forth small jets of white steam from numerous vents situated around its breached and nearly filled up crater. Some few and light outbursts with ejection of ashes are reported as occurred in different occasions, 1852, 1889 and 1894.

Far more important were the eruptions which occurred in January 1916 and October 1918; the earth tremors and frequent rumblings and noises, indicated extraordinary awakenings of the dormant volcano. The first began in the early hours of the 18th of January, and during five days numerous small explosions took place, the ejected dust and sand was carried by prevailing northeasters, spreading far out in the southwest direction. After this outbreak the jets of vapor on the top of the mountain and along some radial ravines continued with increased intensity. In October of 1918 these vapor vents took greater proportions, frequent light shocks were felt in the vicinity of the volcano, rumblings and noises being audible from the near towns. Occasionally dust fell, and at night some incandescence was momentarily seen at the head of the wide and deep ravine which opens to the SSW, and seems to be the main outlet of the old crater.

At the end of December incandescent lava began to pour down the said ravine; an occurrence which caused great alarm to the town and barrios of Irosin situated in front of it.

Later on in January, 1919, the shocks and rumblings ceased, but the eruption of vapors and pouring of lava down the ravine continued with the same activity. The southern part of the crater seems to be filled with a recent but solid current of black lava, its front appearing at the head of the ravine. From it apparently proceed black steaming masses of different sizes which frequently drop tumbling down the ravine. During the night red incandescence appears on the top and immediately incandescent masses tumble down sparkling brightly.

At long intervals a current, like a very thick crawling cloud is seen to rush down the ravine in furious effervescence; its yellowish color resembling it to a current of furiously boiling mud: by and by it rises and thins until it catches the prevailing wind and is carried by it dropping the dust of which it seems to be composed and leaving the ground over which passes covered with a dry whitish mantle. These two aspects of the eruption have been depicted as they appear from a distance of about eight kilometers.

As there has not been observed any sudden increase nor any explosive movement in the big throws of white vapor constantly issuing from the crater, it seems that the falling of lava is due to overflowings rather than to explosions. Supports this idea the fact that the various reports or noises heard during the pourings correspond to the exploding and breaking of the masses, while they are tumbling down the ravine. During

the day the ejected materials are seen as black steaming rocks and at night as red sparkling masses.

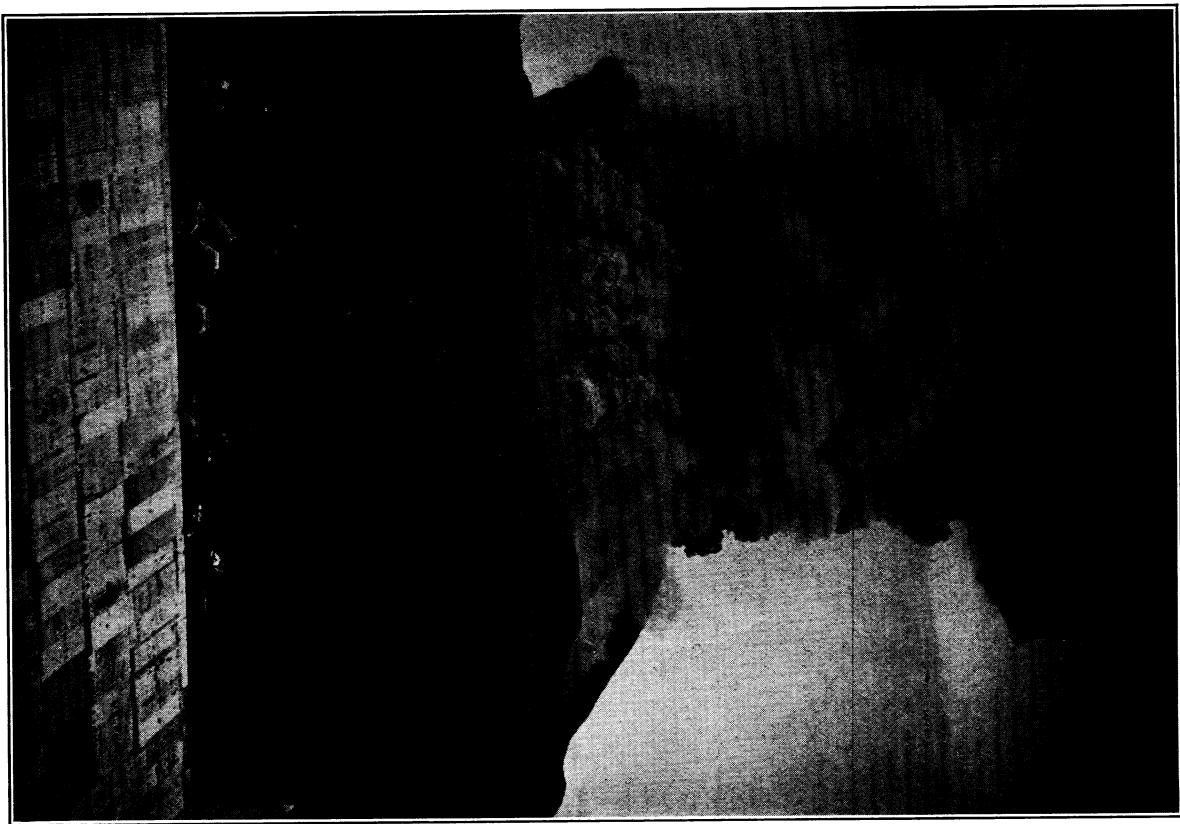

At the time of writing this note, five months after the beginning of the pouring of lava, the eruptions continue but with very different character. The pouring of lava continued without apparent change, but decreasing in quantity until the end of March when it ceased to be visible, although probably it was yet rising and accumulating in the northern part of the crater. At the same time the central vapor jet and those issuing from the western ravine became more powerful.

During the first days of April occurred a small lateral eruption, which opened a craterlet and some cracks on the SSE rim of the crater: the activity of the craterlet lasted but few days.

On the 24th of April shorter after 22<sup>h</sup> a fearful eruption took place: an immense cloud of vapor and sand rising to a great height. There were not very loud noises and the small quantity of ashes fallen did but little damage to the vegetation, which covers the mountain up to a short distance from the crater. At about 4<sup>h</sup> on the 27th occurred two similar but much lesser outbursts.

Finally on the 10th of May at 14<sup>h</sup> 40<sup>m</sup> the volcano had the most spectacular eruption. A very thick blackish cloud, which at the moment of issuing from the crevasses of the crater resembled foaming mud pouring along the exterior breaches and ravines, raised to a height of more than 2,000 meters. The eruptive force was such that counterbalanced the fresh wind then prevailing and the column kept its verticality to a very great height. The big cloud was slowly carried towards the west, where caused much darkness and dropped a small quantity of ashes. This eruption lasted about thirty minutes; soon after, only some powerful jets of white vapor were seen crowning the volcano. Not a single perceptible earth-shock preceded the outburst: a seismograph placed at a distance of about 8 kilometers recorded only two very light disturbances at the beginning and ten minutes later.

So far the damages caused by the eruptions of the Bulusan have been of no consideration: the vegetation is nearly unaffected to the last third of the mountain, a fact which shows that the eruptive clouds contain a very small proportion of ashes and noxious gasses. The Manila Hemp plantations surrounding the mountain up to its first reaches rather benefited from the small falls of ashes, and the benefit would had been greater had the rains fallen this year more abundantly to wash the leaves and precipitate the volcanic dust.

Eruption of Bulusan Volcano, May 10, 1919, as seen from Irosin, 8 kilometers distant to the South.

Bulusan Volcano steaming, May 12, 1919.

## LAS RECIENTES ERUPCIONES DEL VOLCÁN BULUSAN, 1916 Y 1918.

---

El Volcán Bulusan, el más oriental de los de la Isla de Luzón, está situado en su extremo SE junto al Estrecho de San Bernardino, que separa las Islas de Luzón y de Sámar. Su posición geográfica aproximada es de  $12^{\circ} 47' N$  y  $124^{\circ} 4' E$  y su altura de unos 1,500 metros.

No existen datos históricos de ninguna erupción importante; durante siglos se le ha considerado como durmiente: solamente algunas veces se vieron salir pequeños penachos de blanco vapor de varias grietas situadas alrededor de su cráter, muy deformado, abierto por varios sitios y casi lleno. Se mencionan además algunas pequeñas erupciones de ceniza y arena que tuvieron lugar por los años 1852, 1889 y 1894.

Más importantes que ninguna de estas son las que ocurrieron en 1916 y 1918: los pequeños temblores de tierra, frecuentes retumbos y ruidos que las precedieron y acompañaron eran ciertamente indicios de extraordinario despertar del volcán. Comenzó la primera en la madrugada del 18 de enero y durante cinco días pequeñas explosiones se repitieron a intervalos más o menos largos, arrojando abundancia de polvo y arena, que llevados por los nordestes fueron a caer a grandes distancias sobre los pueblos y campos del sudeste del volcán. Al terminar este período explosivo la emisión de vapores de las grietas antes mencionadas y de dos barrancos, que descienden por el W del cráter, continuó con extraordinaria intensidad. En octubre de 1918, los chorros de vapor tomaron proporciones extraordinarias, volvieron a menudear pequeñas sacudidas del suelo en la región del volcán y los pueblos vecinos oyeron otra vez retumbos y ruidos. Llovió en algunas ocasiones algo de ceniza, y de noche se distinguieron momentáneas incandescencias a lo alto del gran barranco que mira al SSW y parece ser el principal desagüe que se origina en el interior del cráter.

A fines de diciembre observóse que por dicho barranco se precipitaban masas de lava candente; cosa que alarmó mucho al pueblo y barrios de Irosin situados al frente de él.

Luego en enero, 1919, los movimientos del suelo y los ruidos cesaron, pero la grande erupción de vapores y los desprendimientos de lava, rodando por el barranco abajo, continuaban con la misma actividad. La parte sur del cráter aparecía cubierta de una potente capa o corriente de lava negra solidificada, cuyo frente asomaba a lo alto de la gran garganta o barranco. De ella parecían desprenderse masas negras de piedra humeante, que a intervalos frecuentes se despeñaban por el barranco abajo. Durante la noche veíase aparecer incandescencia a lo alto y despeñarse luego rojas piedras que al explotar y romperse despedían brillantes chispas.

A intervalos mucho más largos, veíase de día precipitarse abajo con velocidad vertiginosa, pero siguiendo las sinuosidades del barranco, una como nube densísima y rastrera violentamente agitada; su color amarillento le daba el aspecto de una corriente de lodo en furiosa efervescencia: poco a poco se iba adelgazando y levantando hasta llegar a las corrientes exteriores de aire, las cuales la arrastraban, al mismo tiempo que iba soltando una lluvia de polvo que dejaba blanquecinos los sitios sobre que era llevada. Estos dos aspectos o formas de desprendimientos volcánicos de materia sólida se describen tales como aparecen desde unos 8 kilómetros de distancia.

Puesto que ni antes ni durante ninguna de las dos diferentes emisiones de lava descritas, se nota aumento alguno extraordinario ni movimiento explosivo en los potentes chorros de vapor que coronan el volcán, probablemente los desprendimientos de lava son debidos a rebosamientos más o menos frecuentes y no a proyecciones violentas. Parece apoyar esta suposición el no oírse de día ni de noche otros ruidos que débiles detonaciones, las cuales parecen corresponder al explotar y romperse de las piedras cándentes que ruedan por la pendiente del barranco. Según se dijo antes, durante el día se ven claramente piedras negras y humeantes de diferentes tamaños y, durante la noche, masas en incandescencia y chispeantes que ruedan por la pendiente y se dividen en menudos pedazos.

Al escribir esta nota, cinco meses después del comienzo de los desprendimientos de lava, las erupciones se repiten, pero con diversos caracteres: El derrame de lava continuó sin cambio aparente pero disminuyendo, hasta fines de marzo, en que dejó de ser visible, si bien es probable que aún seguía acumulándose en la parte norte del cráter. Al mismo tiempo las fumarolas del centro del cráter y de la brecha del oeste crecieron en intensidad.

A principios de abril ocurrió una erupción lateral que abrió un pequeño cráter y algunas grietas cerca del borde SSE del cráter principal; mas la actividad del diminuto cráter duró muy pocos días.

El 24 de abril poco después de las 22<sup>h</sup> tuvo lugar una fuerte erupción en la que se levantó a grande altura una nube inmensa de vapor y arenilla, pero sin grandes detonaciones ni causar daño notable a la vegetación que cubre todavía el volcán hasta muy cerca del cráter. Ocurrieron otras dos de menos intensidad a las 4<sup>h</sup> del 27.

Por fin el 10 de mayo a las 14<sup>h</sup> 40<sup>m</sup> ocurrió la erupción más grande y visible de este volcán. Una nube densísima y negruzca, la cual al momento de salir parecía espumante barro que se derramaba por las grietas exteriores del cráter, se le levantó con moderadas detonaciones a una altura de más de 2,000 metros. A pesar del viento fresco del E conservaba su verticalidad hasta su mayor altura, indicando lo intenso de la fuerza y velocidad eruptiva. Luego el viento reinante la fué arrastrando hacia el W donde produjo grande oscuridad y desprendió una pequeña cantidad de arenilla fina. Esta erupción duró cosa de media hora quedando después el volcán con solos los penachos blancos de los chorros de vapor. No se notaron sacudidas del suelo; un sismógrafo que funcionaba a la distancia de 8 kilómetros registró dos movimientos del suelo uno al comenzar y otro diez minutos después.

Hasta ahora los daños causados por las diferentes erupciones pueden considerarse como nulos; la vegetación continúa intacta hasta el último tercio de la montaña, indicación cierta de que las erupciones constan principalmente de vapor de agua y muy pocos productos sólidos. Las plantaciones de abacá que ocupan la base de la montaña, puede decirse que han salido beneficiadas con las pequeñas caídas de arena y ceniza y lo habrían sido más en épocas de más abundantes lluvias que precipitaran pronto el polvo, dejando lavadas las hojas.

## METEOROLOGICAL BULLETIN FOR FEBRUARY, 1919.

By Rev. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

### GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure for this month in the Philippines is slightly to moderately higher than that of the preceding year and than the normal of this month. The highest pressures were generally observed on the 5th and 6th, while the lowest were recorded almost without exception on the 22d.

The mean monthly temperature is also slightly to moderately higher than that of the preceding year, and slightly above the February's normal. The absolute maximum and minimum temperatures for Manila were 33.9° C. and 16.7° C., the former having been observed on the 22d, and the latter on the 3d and 4th. The extreme monthly temperatures for Baguio were 26.4° C., 12.1° C. on the top of Mirador, and 26.4° C., 9.5° C. in the valley.

<sup>a</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—With only three or four exceptions, the monthly total rainfall for the Philippines is lower than the normal for February; and only eight stations in Luzon reported a monthly amount of rainfall above that of the preceding year. The total monthly rainfall for Manila is but 0.4 mm. above the normal, while that of Baguio is 5.2 mm. below it.

## DEPRESSIONS AND TYPHOONS.

As is usually the case in February, no depression or typhoon was observed during the month in low latitudes throughout the Far East. In higher latitudes there were several depressions moving generally northeastward to the south of Japan. And, although they were not formed over the Continent, but over the Eastern Sea or over the Pacific, yet they rather belong to the type of Continental depressions, which hardly affect the weather in the Philippines.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes en Filipinas es ligera o moderadamente mayor que la del año pasado y que la normal de febrero. Las presiones más altas se observaron generalmente los días 5 y 6, en tanto que las más bajas se registraron casi sin excepción el día 22.

La temperatura media mensual es asimismo ligera o moderadamente mayor que la del año pasado, y ligeramente mayor que la normal de este mes. Las temperaturas máxima y mínima absolutas de Manila fueron  $33.9^{\circ}$  C. y  $16.7^{\circ}$  C., habiéndose observado aquélla el día 22, y ésta los días 3 y 4. Las temperaturas extremas del mes en Baguio fueron  $26.4^{\circ}$  C.,  $12.1^{\circ}$  C. en la cumbre del Mirador, y  $26.4^{\circ}$  C.,  $9.5^{\circ}$  C. en el valle.

**Precipitación acuosa.**—Con solas tres o cuatro excepciones, la lluvia total del mes en Filipinas es menor que la normal de febrero; y sólo ocho estaciones de Luzón registraron una cantidad mensual de lluvia mayor que la del año pasado. La lluvia total del mes en Manila sólo excede a la normal en 0.4 mm., al paso que la de Baguio es menor que ella en 5.2 mm.

## DEPRESIONES Y TIFONES.

Como sucede ordinariamente en febrero, ninguna depresión o tifón se observó durante el mes en bajas latitudes en todo el Extremo Oriente. En altas latitudes hubo varias depresiones que se movieron generalmente al NE por el sur de Japón. Y, aun cuando no se formaron en el Continente, sino en el Mar del Este o en el Pacífico, con todo pertenecen más bien al tipo de las depresiones continentales, que apenas ejercen influencia en el tiempo de Filipinas.

## SEISMOLOGICAL BULLETIN FOR FEBRUARY, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

- 1, 7<sup>h</sup> 46<sup>m</sup> [1, 15<sup>h</sup> 46<sup>m</sup>]. Ormoc (W Leyte). Earthquake shock of intensity II-III.
- 3, 19<sup>h</sup> 26<sup>m</sup> [4, 5<sup>h</sup> 05<sup>m</sup>]. Guam (Mariana Islands). Oscillatory earthquake of intensity III-IV.
- 4, 13<sup>h</sup> 6<sup>m</sup> [4, 21<sup>h</sup> 6<sup>m</sup>]. Cape Bojeador (NW Luzon). Earthquake of intensity IV-V, duration 8 seconds.
- 8, 13<sup>h</sup> 28<sup>m</sup> [8, 21<sup>h</sup> 28<sup>m</sup>]. Vigan (NW Luzon). Earthquake shock of intensity II-III.
- 8, 16<sup>h</sup> 4<sup>m</sup> [9, 0<sup>h</sup> 4<sup>m</sup>]. Ormoc (W Leyte). Oscillatory and subsultory earthquake, direction W-E, intensity V, duration 10 seconds. It repeated with intensity III at 14<sup>h</sup> 53<sup>m</sup> [22<sup>h</sup> 53<sup>m</sup>].
- 13, 23<sup>h</sup> 5<sup>m</sup> 18<sup>s\*</sup> [14, 7<sup>h</sup> 5<sup>m</sup> 18<sup>s</sup>]. Eastern Visayas and Mindanao. Very extensive earthquake felt through eastern Mindanao and Visayas and in the SE part of Luzon, which represent an area more than 800 kilometers long. The origin of the disturbance lay in the Philippine Deep, but far off towards the meridian 127° E, near to the 11° N parallel; its intensity did not exceed degree III in any of the Philippine lands where it was felt.
- 15, 10<sup>h</sup> 45<sup>m</sup> [15, 18<sup>h</sup> 45<sup>m</sup>]. Camiguin Island (N of Mindanao). Earthquake of intensity III, near origin: recorded at Butuan.
- 17, 3<sup>h</sup> 41<sup>m</sup> 42<sup>s\*</sup> [17, 11<sup>h</sup> 41<sup>m</sup> 42<sup>s</sup>]. E Mindanao. Earthquake felt lightly at Butuan and other places of eastern Mindanao. The origin lay far off to the east in the Pacific.
- 18, 21<sup>h</sup> 5<sup>m</sup> [19, 6<sup>h</sup> 44<sup>m</sup>]. Guam (Mariana Islands). Earthquake of intensity III-IV.
- 22, 17<sup>h</sup> 12<sup>m</sup> 0<sup>s\*</sup> [23, 1<sup>h</sup> 12<sup>m</sup> 0<sup>s</sup>]. Butuan. (N Mindanao). Oscillatory earthquake, direction E-W, intensity III, duration over 30 seconds. Probable origin towards the east in the Pacific.
- 24, 21<sup>h</sup> 26<sup>m</sup> [25, 5<sup>h</sup> 26<sup>m</sup>]. Butuan (N Mindanao). Oscillatory earthquake of intensity III. Foreshock one hour earlier. Local and near origin.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

## RECORDS OF THE MICROSEISMOGRAPH.

[Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N$ :  $T_0=6.62$ ,  $\epsilon=2.726$ ,  $\frac{r}{T_0^2}=0.021$ ;  $A_E$ :  $T_0=6.03$ ,  $\epsilon=2.378$ ,  $\frac{r}{T_0^2}=0.037$ . Alluvium. 2.40 meters above sea level.]

TEMBLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

1, 7<sup>h</sup> 46<sup>m</sup> [1, 15<sup>h</sup> 46<sup>m</sup>]. Ormoc (W de Leyte). Temblor de tierra de intensidad II-III.

3, 19<sup>h</sup> 26<sup>m</sup> [4, 5<sup>h</sup> 05<sup>m</sup>]. Guam (Islas Marianas). Temblor oscilatorio de intensidad III-IV.

4, 13<sup>h</sup> 6<sup>m</sup> [4, 21<sup>h</sup> 6<sup>m</sup>]. Cabo Bojeador (NW de Luzón). Temblor de tierra de intensidad IV-V, duración 8 segundos.

8, 13<sup>h</sup> 28<sup>m</sup> [8, 21<sup>h</sup> 28<sup>m</sup>]. Vigan (NW de Luzón). Temblor de tierra de intensidad II-III.

8, 16<sup>h</sup> 4<sup>m</sup> [9, 0<sup>h</sup> 4<sup>m</sup>]. Ormoc (W de Leyte). Temblor oscilatorio y susultorio, dirección W-E, intensidad V, duración 10 segundos. Repitió con intensidad III a 14<sup>h</sup> 53<sup>m</sup> [22<sup>h</sup> 53<sup>m</sup>] del mismo día 9.

13, 23<sup>h</sup> 5<sup>m</sup> 18<sup>s\*</sup> [14, 7<sup>h</sup> 5<sup>m</sup> 18<sup>s</sup>]. Visayas Orientales y Mindanao. Extensísimo temblor de tierra sentido en la parte oriental de Mindanao, Islas Visayas del E y en el extremo SE de Luzón; una zona de más de 800 kilómetros de longitud. Su origen se hallaba en el Pacífico en el Abismo de Filipinas pero lejos del Archipiélago hacia el meridiano 127° E y el paralelo 11° N. Por consiguiente no pasó de intensidad III en ninguna de las regiones de él donde fué perceptible.

15, 10<sup>h</sup> 45<sup>m</sup> [15, 18<sup>h</sup> 45<sup>m</sup>]. Isla Camiguín (N de Mindanao). Temblor de tierra de intensidad III, de origen muy cercano; registrado en la vecina estación de Butúan.

17, 3<sup>h</sup> 41<sup>m</sup> 42<sup>s\*</sup> [17, 11<sup>h</sup> 41<sup>m</sup> 42<sup>s</sup>]. E de Mindanao. Temblor de tierra sentido débilmente en Butúan y otros sitios de la parte oriental de Mindanao; originado sin duda en el Pacífico a bastante distancia al E de la isla.

18, 21<sup>h</sup> 5<sup>m</sup> [19, 6<sup>h</sup> 44<sup>m</sup>]. Guam (Islas Marianas). Temblor de tierra de intensidad III-IV.

22, 17<sup>h</sup> 12<sup>m</sup> 0<sup>s\*</sup> [23, 1<sup>h</sup> 12<sup>m</sup> 0<sup>s</sup>]. Butúan (N de Mindanao). Temblor oscilatorio, dirección E-W, intensidad III, duración más de 30 segundos. El origen parece se hallaba algo distante al E en el Pacífico.

24, 21<sup>h</sup> 26<sup>m</sup> [25, 5<sup>h</sup> 26<sup>m</sup>]. Butúan (N de Mindanao). Temblor oscilatorio de intensidad II-III. Una hora antes ocurrió una sacudida de menor intensidad. El origen de ambos parece era cercano y muy local.

---

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

## BULLETIN FOR MARCH, 1919.

# METEOROLOGICAL BULLETIN FOR MARCH, 1919.

By REV. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure for this month in the Philippines is somewhat higher than that of the preceding year and than the normal of March. The highest pressures were observed on the 19th, and the lowest on the 31st.

The mean monthly temperature is also above the normal of this month and above the monthly mean of the preceding year, particularly in Luzon. The extreme temperatures for Baguio were 27.5° C., 12.2° C. on the top of Mirador, and 27.7° C., 9.2° C. in the valley. The highest and lowest temperatures of the month in Manila were 36.2° C. on the 25th, and 17.1° C. on the 6th. It is to be remarked that only once since 1880 was the maximum temperature for March at Manila higher than that of this year, and that only three times in that period was as high as 36.1° C. or 36.2° C. The highest of the whole period was 36.4° C., recorded on March, 1915. Four stations in Luzon, namely Tuguegarao, Laoag, Dagupan and San Isidro, have reported a maximum monthly temperature as high as, or even higher than, 38° C.

<sup>a</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—With a few exceptions in southern Mindanao and the western part and the northern coast of Luzon, the total monthly amount of rainfall in the Philippines is below that of March, 1918, and below the normal of this month. No more than 1.9 mm. of water were collected during the month in the rain gauges of Manila Observatory, this amount being 16.6 mm. below the normal for this month.

## RAINFALL AT VARIOUS STATIONS OF THE WEATHER BUREAU DURING THE MONTH OF MARCH, 1919.

## DEPRESSIONS AND TYPHOONS.

There was not a single depression or typhoon near the Philippines during this month. And even in the whole Far East there were only several depressions moving eastward across the Eastern Sea and to the south of Japan, which belong rather to the type of depressions generally known as continental depressions.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes en Filipinas es algo mayor que la del mismo mes del año pasado y que su correspondiente normal. Las presiones más altas se observaron el día 19 y las más bajas el 31.

La temperatura media mensual es también mayor que la normal de este mes y que la media mensual del año pasado, especialmente en Luzón. Las temperaturas extremas en Baguio fueron 27.5° C., 12.2° C. en la cumbre del Mirador, y 27.7° C., 9.2° C. en el valle. La máxima y mínima absolutas en Manila fueron 36.2° C. y 17.1°., registradas respectivamente los días 25 y 6. Es de notar que desde 1880 la máxima temperatura de marzo en Manila fué una sola vez mayor que la de este año y tres veces solamente alcanzó a 36.1° C. ó 36.2° C. La mayor temperatura observada en todo el período 1880-1919 fué 36.4° C., registrada en marzo de 1915. Las cuatro estaciones de Luzón, Tuguegarao, Laoag, Dagupan y San Isidro, han accusado una máxima temperatura mensual de 38° C. ó más.

**Precipitación acuosa.**—Con unas pocas excepciones en el sur de Mindanao y en la parte occidental y costa septentrional de Luzón, la lluvia total del mes en Filipinas es menor que la de marzo, 1918, y que la normal de este mes. La cantidad recogida en los pluviómetros del Observatorio de Manila fué solamente 1.9 mm., cantidad inferior a la normal de este mes en 16.6 mm.

## DEPRESIONES Y TIFONES.

No hubo ni una sola depresión o tifón cerca de Filipinas durante el mes. Y aun en todo el Extremo Oriente hubo solamente varias depresiones que se movieron hacia el E a través del Mar del Este y al sur de Japón, las cuales pertenecen más bien al tipo de depresiones generalmente conocidas como depresiones continentales.

\* All the mean values given in this table are deduced from six daily observations taken at 2, 6, 10 a. m. and 2, 6, 10 p. m.

<sup>b</sup> The barometric readings of this station are not reduced to sea level.

<sup>c</sup> Maximum of hourly observations taken from 6 a. m. to 6 p. m.

<sup>d</sup> This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

<sup>e</sup> 6 hours missing.

## SEISMOLOGICAL BULLETIN FOR MARCH, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
Chief, Seismic and Magnetic Divisions, Weather Bureau.

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

3, 2<sup>h</sup> 36<sup>m</sup> 41<sup>s\*</sup> [3, 10<sup>h</sup> 36<sup>m</sup> 41<sup>s</sup>]. E Mindanao. Earthquake originated in the Pacific and felt with intensity II-III in some stations of eastern and northern Mindanao. It was also recorded outside of the Philippines.

6, 7<sup>h</sup> 22<sup>m</sup> 56<sup>s\*</sup> [6, 15<sup>h</sup> 22<sup>m</sup> 56<sup>s</sup>]. E Mindanao. Earthquake similar to the preceding one, and apparently originated in the same place.

7, 1<sup>h</sup> 12<sup>m</sup> 12<sup>s\*</sup> [7, 9<sup>h</sup> 12<sup>m</sup> 12<sup>s</sup>]. S Mindanao. Earthquake of intensity III in the Cotabato district. It originated in the Celebes Sea. Two light aftershocks occurred respectively at 8<sup>h</sup> 20<sup>m</sup> and 10<sup>h</sup> 13<sup>m</sup> [16<sup>h</sup> 20<sup>m</sup>, 18<sup>h</sup> 13<sup>m</sup>]: the seismograph at Butuan recorded also five minor disturbances, all originated in the said sea.

7, 12<sup>h</sup> 56<sup>m</sup> [7, 20<sup>h</sup> 56<sup>m</sup>]. Catbalogan (W Samar).

Earthquake shock of intensity III.

8, 11<sup>h</sup> 0<sup>m</sup> [8, 19<sup>h</sup> 0<sup>m</sup>]. Antique (W Panay). Earthquake shock of intensity II-III, short duration.

11, 4<sup>h</sup> 43<sup>m</sup> [11, 12<sup>h</sup> 43<sup>m</sup>]. Cotabato (SW Mindanao). Earthquake of intensity III; recorded at Butuan.

11, 8<sup>h</sup> 33<sup>m</sup> 31<sup>s\*</sup> [11, 16<sup>h</sup> 33<sup>m</sup> 31<sup>s</sup>]. N Mindanao. Earthquake felt with intensity III in the Camiguin Island and recorded also at Butuan: its epicenter probably lay within the Island of Mindanao, W of the Agusan Valley.

15, 14<sup>h</sup> 8<sup>m</sup> 8<sup>s\*</sup> [15, 22<sup>h</sup> 8<sup>m</sup> 8<sup>s</sup>]. N Luzon. Earthquake of intensity IV, felt through the provinces of Ilocos Norte, Apayao and Cagayan.

16, 7<sup>h</sup> 35<sup>m</sup> 14<sup>s\*</sup> [16, 15<sup>h</sup> 35<sup>m</sup> 14<sup>s</sup>]. E Mindanao and Visayas. Extensive earthquake, originated in the Pacific and felt through central and eastern Mindanao and the islands of Samar and Leyte. Its intensity was variable at different stations, depending very likely on the nature of the soil: so it reached intensity V in the Agusan alluvials at Butuan, intensity IV in the volcanics of Davao and III in some other places of eastern Mindanao. It was recorded throughout the world.

During the first thirty minutes after the earthquake occurred for light perceptible aftershocks: the seismographs of Butuan and Camiguin Island recorded forty instrumental disturbances up 15<sup>h</sup> 4<sup>m</sup> 55<sup>s\*</sup> [23<sup>h</sup> 4<sup>m</sup> 55<sup>s</sup>]. At that hour a second earthquake was felt, recorded also throughout the world. The number of instrumental disturbances recorded during the 17th reached thirty-eight, with seven perceptible shocks. On the 18th twenty instrumental disturbances were recorded with only one perceptible shock: on the 19th the number of instrumental disturbances fell to nine with one perceptible shock. On the 20th only a light shock occurred at 20<sup>h</sup> 43<sup>m</sup> [21, 4<sup>h</sup> 43<sup>m</sup>] followed by two instrumental aftershocks.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (mid-night=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

21, 1<sup>h</sup> 3<sup>m</sup> 2<sup>s</sup>\* [21, 9<sup>h</sup> 3<sup>m</sup> 2<sup>s</sup>]. Southern Luzon and Visayas. Extensive earthquake felt through the southern and southeastern part of Luzon and the islands of Mindoro, Marinduque, Romblon, Panay, and Masbate. Its meizoseismic area extended itself from Marinduque northwards, across the isthmus of Tayabas, to the Baler Bay, nearly along the meridian 122° E and following the direction of one of the main seismotectonic lines of the Archipelago.<sup>(1)</sup> In the island of Marinduque it reached intensity VII, while the isoseismal V–VI embraced the northeast portion of Mindoro, the whole provinces of Tayabas and Laguna and the eastern part of those of Batangas, Rizal, Bulacan and Nueva Ecija. The total area shaken had an approximate extension of 500 kilometers in the E–W and more than 700 kilometers in the N–S direction.

The seismographs of the observatory recorded but four light aftershocks: the main earthquake seems to have been recorded only in the stations of the Far East.

21, 17<sup>h</sup> 22<sup>m</sup> 58<sup>s</sup>\* [22, 1<sup>h</sup> 22<sup>m</sup> 58<sup>s</sup>]. E Mindanao and Visayas. Earthquake of intensity IV, felt through eastern Mindanao and the islands of Samar and Leyte. The epicenter probably lay near to the NE end of Mindanao.

22, 1<sup>h</sup> 40<sup>m</sup> [22, 9<sup>h</sup> 40<sup>m</sup>]. Legaspi (SE Luzon). Oscillatory earthquake, direction NE–SW, intensity III, duration 8 seconds.

23, 22<sup>h</sup> 53<sup>m</sup> 2<sup>s</sup>\* [24, 6<sup>h</sup> 53<sup>m</sup> 2<sup>s</sup>]. NE Mindanao and Visayas. Earthquake of intensity IV, originated in the Philippine Deep, E of Samar. It was felt in Samar, Leyte, Cebu, Bohol and NE Mindanao.

25, 14<sup>h</sup> 23<sup>m</sup> 4<sup>s</sup>\* [25, 22<sup>h</sup> 23<sup>m</sup> 4<sup>s</sup>]. Cotabato (SW Mindanao). Earthquake felt with intensity III in the central part of the Cotabato district. The origin of the disturbance lay towards the south in the Celebes Sea.

25, 18<sup>h</sup> 45<sup>m</sup> [26, 2<sup>h</sup> 45<sup>m</sup>]. Antique (W Panay). Oscillatory earthquake, direction W–E, intensity III, duration 5 seconds.

29, 2<sup>h</sup> 23<sup>m</sup> 29<sup>s</sup>\* [29, 10<sup>h</sup> 23<sup>m</sup> 29<sup>s</sup>]. Atimonan (E Luzon). Earthquake shock of intensity II–III.

---

TEMBOLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

3, 2<sup>h</sup> 36<sup>m</sup> 41<sup>s\*</sup> [3, 10<sup>h</sup> 36<sup>m</sup> 41<sup>s</sup>]. E de Mindanao. Temblor de tierra de origen algo lejano en el Pacífico; sentido con intensidad II-III en algunas estaciones del E y N de Mindanao. Registrado fuera de Filipinas.

6, 7<sup>h</sup> 22<sup>m</sup> 56<sup>s\*</sup> [6, 15<sup>h</sup> 22<sup>m</sup> 56<sup>s</sup>]. E de Mindanao. Temblor de tierra semejante al precedente y originado al parecer hacia el mismo punto en el Pacífico.

7, 1<sup>h</sup> 12<sup>m</sup> 12<sup>s\*</sup> [7, 9<sup>h</sup> 12<sup>m</sup> 12<sup>s</sup>]. S de Mindanao. Temblor de tierra sentido con intensidad III en la provincia de Cotabato. Originado en el Mar de Célebes. Hubo dos repeticiones más ligeras, sentidas en Cotabato a 8<sup>h</sup> 20<sup>m</sup> y 10<sup>h</sup> 13<sup>m</sup> [16<sup>h</sup> 20<sup>m</sup>, 18<sup>h</sup> 13<sup>m</sup>]. El sismógrafo de Butúan registró además otros cinco choques: todos al parecer tenían su origen en el Mar de Célebes.

7, 12<sup>h</sup> 56<sup>m</sup> [7, 20<sup>h</sup> 56<sup>m</sup>]. Catbalogan (W de Sámar). Temblor de tierra de intensidad III.

8, 11<sup>h</sup> 0<sup>m</sup> [8, 19<sup>h</sup> 0<sup>m</sup>]. Antique (W de Panay). Temblor de tierra de intensidad II-III, duración muy corta.

11, 4<sup>h</sup> 43<sup>m</sup> [11, 12<sup>h</sup> 43<sup>m</sup>]. Cotabato (SW de Mindanao). Temblor de tierra de intensidad III; registrado en Butúan.

11, 8<sup>h</sup> 33<sup>m</sup> 31<sup>s\*</sup> [11, 16<sup>h</sup> 33<sup>m</sup> 31<sup>s</sup>]. N de Mindanao. Temblor de tierra, sentido con intensidad III en la Isla de Camiguín y registrado también en Butúan; su epicentro se hallaba probablemente en la Isla de Mindanao al W del Valle del Agusan.

15, 14<sup>h</sup> 8<sup>m</sup> 8<sup>s\*</sup> [15, 22<sup>h</sup> 8<sup>m</sup> 8<sup>s</sup>]. N de Luzón. Temblor de tierra de intensidad IV sentido en las provincias de Ilocos Norte, Apayao y Cagayán.

16, 7<sup>h</sup> 35<sup>m</sup> 14<sup>s\*</sup> [16, 15<sup>h</sup> 35<sup>m</sup> 14<sup>s</sup>]. E de Mindanao y Visayas. Temblor de tierra de grande extensión, originado en el Pacífico y sentido en toda la parte oriental y central de Mindanao y en las Islas de Sámar y Leyte, con intensidad variable, dependiendo al parecer de las condiciones del suelo: así fué de intensidad V, en los aluviones del Agusan de las cercanías de Butúan; de intensidad IV en los terrenos volcánicos de Dávao y de III en otros sitios del E de Mindanao. Registrado en todo el mundo.

Siguió una serie de cuatro choques muy ligeros durante la primera media hora después del terremoto; además los sismógrafos de Butúan y de la Isla de Camiguín registraron 40 choques instrumentales hasta las 15<sup>h</sup> 4<sup>m</sup> 55<sup>s\*</sup> [23<sup>h</sup> 4<sup>m</sup> 55<sup>s</sup>]. A esta hora ocurrió un segundo terremoto, registrado también en todo el mundo, al cual sucedieron 38 choques instrumentales y 7 perceptibles durante el día 17. El 18 se registraron 20 choques instrumentales con uno perceptible. El 19 ya no se registraron más que 9, mientras que el día 20 fué ya normal, con solo un temblor perceptible a 20<sup>h</sup> 43<sup>m</sup> [21, 4<sup>h</sup> 43<sup>m</sup>] y dos repeticiones.

21, 1<sup>h</sup> 3<sup>m</sup> 2<sup>s\*</sup> [21, 9<sup>h</sup> 3<sup>m</sup> 2<sup>s</sup>]. S de Luzón y Visayas. Extenso temblor de tierra sentido en toda la parte sur y sureste de Luzón y en las Islas de Mindoro, Marinduque, Romblón, Panay y Masbate. El área meizosísmica se prolongaba desde Marinduque hacia el N, por el itsmo de Tayabas, hasta la Bahía de Baler, próximamente a lo largo del meridiano 122° E, y al parecer coincidiendo con una línea sismotectónica de las más importantes de Filipinas.<sup>(2)</sup> Desarrolló su mayor intensidad VII en la Isla de Marinduque y sus cercanías. La isosísmica V-VI encerraba la parte NE de Mindoro, las

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

<sup>2</sup> The Relation of Seismic Disturbances in the Philippines to the Geologic Structure. *The Phil. Journal of Science*, Vol. VIII, Sec. A, p. 220.

Provincias de Tayabas y Laguna y la parte oriental de las de Batangas, Rizal, Bulacán y Nueva Écija. Fué perceptible en un área total que se extendía unos 500 kilómetros de E a W y más de 700 de N a S. Los sismógrafos de Manila registraron cuatro repeticiones de muy poca importancia. Fuera del Archipiélago sólo parece que fué registrado en las estaciones del Extremo Oriente.

21, 17<sup>h</sup> 22<sup>m</sup> 58<sup>s</sup>\* [22, 1<sup>h</sup> 22<sup>m</sup> 58<sup>s</sup>]. E de Mindanao y Visayas. Temblor de intensidad IV sentido en la parte E de Mindanao y en las Islas de Sámar y Leyte. El epicentro parece se hallaba cerca de la parte NE de Mindanao.

22, 1<sup>h</sup> 40<sup>m</sup> [22, 9<sup>h</sup> 40<sup>m</sup>]. Legaspi (SE de Luzón). Temblor oscilatorio, dirección NE-SW, intensidad III, duración 8 segundos.

23, 22<sup>h</sup> 53<sup>m</sup> 2<sup>s</sup>\* [24, 6<sup>h</sup> 53<sup>m</sup> 2<sup>s</sup>]. NE de Mindanao y Visayas. Temblor de tierra de intensidad IV, originado en el Abismo de Filipinas al E de Sámar. Sintióse en las Islas Visayas de Sámar, Leyte, Bohol y Cebú y en la parte NE de Mindanao.

25, 14<sup>h</sup> 23<sup>m</sup> 4<sup>s</sup>\* [25, 22<sup>h</sup> 23<sup>m</sup> 4<sup>s</sup>]. Cotabato (SW de Mindanao). Temblor de tierra de intensidad III en la parte central del distrito. Su origen se hallaba al parecer hacia el sur en el Mar de Célebes.

25, 18<sup>h</sup> 45<sup>m</sup> [26, 2<sup>h</sup> 45<sup>m</sup>]. Antique (W de Panay). Temblor oscilatorio, dirección W-E, intensidad III, duración 5 segundos.

29, 2<sup>h</sup> 23<sup>m</sup> 29<sup>s</sup>\* [29, 10<sup>h</sup> 23<sup>m</sup> 29<sup>s</sup>]. Atimonan (E de Luzón). Temblor de tierra de intensidad II-III.

## BULLETIN FOR APRIL, 1919.

# METEOROLOGICAL BULLETIN FOR APRIL, 1919.

By Rev. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure for this month in the Philippines has been almost without exception somewhat higher than that of the preceding year and than the April's normal. The highest pressures were generally observed on the 20th, and the lowest on the 9th or 10th.

The mean monthly temperature is also above the normal and above that of April, 1918, in practically all the stations of the Philippines. The monthly absolute maximum and minimum temperatures for Manila were 37.7° C. and 19.8° C.: they were registered on the 16th and 17th, respectively. The extreme temperatures for Baguio were 26.9° C., 15.1° C. on the top of Mirador, and 27.0° C., 14.6° C. in the valley.

Only once since 1880 has the absolute maximum temperature of Manila for the month of April been higher than this year, namely in 1915, when the April's maximum temperature was as high as 38.0° C. During this period of thirty years only seven times has the maximum Manila temperature for April been higher than 37° C.

## PRESSURE AND TEMPERATURE AT THE FIRST AND SECOND CLASS STATIONS FOR APRIL, 1919.

Station.	Pressure.							Temperature.

<sup>a</sup> The barometric readings of this station are not reduced to sea level. <sup>b</sup> 26 days of observation. <sup>c</sup> 25 days of observation.

**Rainfall.**—With a few exceptions, there was a lack of rain reported this month by our stations throughout the Philippines, the total monthly rainfall being in almost all of them below that of the preceding year and also below the normal for April. The amount of rain collected in the rain-gauges of Manila Observatory was only 0.9 mm., while the normal for this month is 33.5 mm. The total monthly rainfall for Baguio differs from the April's normal by —39.4 mm.

## RAINFALL AT VARIOUS STATIONS OF THE WEATHER BUREAU DURING THE MONTH OF APRIL, 1919.

Station.	Total.			Days of rain.	Greatest rainfall in a single day.	Day.	Station.	Total.			Days of rain.	Departure from April, 1918.	Greatest rainfall in a single day.	Day.	
	mm.	mm.	mm.					mm.	mm.	mm.

<sup>a</sup> 26 days of observation.

## DEPRESSIONS AND TYPHOONS.

With the exception of the Continental depressions that moved northeastward or eastward across Japan or the Loochoos and the Bonins, there was not a single depression or typhoon worth mentioning this month in the Far East. Only a low-pressure area of very little importance was noticed on the 8th and 9th moving westward across the Island of Mindanao.

## NOTAS GENERALES DEL TIEMPO.

Presión y temperatura.—La presión atmosférica media de este mes en Filipinas ha sido casi sin excepción algo mayor que la del año pasado y que la normal de abril. Las presiones más altas se observaron generalmente el día 20, y las más bajas el 9 ó 10.

La temperatura media mensual es también mayor que la normal, y que la media de abril de 1918, prácticamente en todas las estaciones del Archipiélago. Las temperaturas máxima y mínima absolutas del mes en Manila fueron  $37.7^{\circ}$  C. y  $19.8^{\circ}$  C., las cuales se registraron los días 16 y 17, respectivamente. Las temperaturas extremas de Baguio fueron  $26.9^{\circ}$  C.,  $15.1^{\circ}$  C. en la cumbre del Mirador, y  $27.0^{\circ}$  C.,  $14.6^{\circ}$  C. en el valle.

Sólo una vez desde 1880 la temperatura máxima absoluta de Manila del mes de abril ha sido mayor que la de este año, es decir en 1915, cuando la máxima temperatura de abril llegó a la altura de  $38.0^{\circ}$  C. Durante este período de treinta años sólo siete veces ha sido la temperatura máxima de Manila del mes de abril mayor de  $37^{\circ}$  C.

Precipitación acuosa.—Salvas raras excepciones, hubo este mes escasez de lluvia en nuestras estaciones de Filipinas, siendo en casi todas ellas el total de lluvia de este mes menor que el del año pasado y menor también que la normal de abril. La cantidad de lluvia recogida en los pluviómetros del Observatorio de Manila fué sólo 0.9 mm., al paso que la normal de este mes es 33.5 mm. La lluvia total del mes en Baguio difiere de la normal en  $-39.4$  mm.

## DEPRESIONES Y TIFONES.

Exceptuando las depresiones continentales que se movieron al NE o E a través del Japón o de Loochoos y de Boníns, puede decirse que no hubo este mes en el Extremo Oriente ni una sola depresión o tifón que merezca mencionarse. Sólo un área de baja presión de muy poca importancia se observó los días 8 y 9 moviéndose al W a través de la Isla de Mindanao.

METEOROLOGICAL DATA FOR MANILA CENTRAL OBSERVATORY.<sup>a</sup>[ $\phi=14^{\circ} 34' 41''$  N;  $\lambda=120^{\circ} 58' 33''$  E; barometer above sea, 14.2 meters; gravity correction not applied, -1.72 mm.]

<sup>a</sup> All the mean values given in this table are deduced from six daily observations taken at 2, 6, 10 a. m. and 2, 6, 10 p. m.<sup>b</sup> The barometric readings of this station are not reduced to sea level.<sup>c</sup> Maximum of hourly observations taken from 6 a. m. to 6 p. m.<sup>d</sup> This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

# SEISMOLOGICAL BULLETIN FOR APRIL, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

## EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

3, 2<sup>h</sup> 52<sup>m</sup> [3, 10<sup>h</sup> 52<sup>m</sup>]. Camarines (SE Luzon). Earthquake of intensity III, felt in the central portion of the province corresponding to the Isarog region. Light repetition at 6<sup>h</sup> 7<sup>m</sup> [14<sup>h</sup> 7<sup>m</sup>].

8, 15<sup>h</sup> 59<sup>m</sup> 0<sup>s\*</sup> [8, 23<sup>h</sup> 59<sup>m</sup> 0<sup>s</sup>]. Butuan (N Mindanao). Oscillatory earthquake of intensity III-IV. Its origin probably lay in the Philippine Deep of the Pacific.

12, 12<sup>h</sup> 14<sup>m</sup> 12<sup>s\*</sup> [12, 20<sup>h</sup> 14<sup>m</sup> 12<sup>s</sup>]. Paracale (SE Luzon). Earthquake of intensity III, duration 15 seconds.

16, 16<sup>h</sup> 42<sup>m</sup> 24<sup>s\*</sup> [17, 0<sup>h</sup> 42<sup>m</sup> 24<sup>s</sup>]. E Mindanao. Earthquake of intensity V, felt through the eastern half of the island. It originated to the E in the Pacific, not far from the coast. Recorded in the Far East.

21, 13<sup>h</sup> 48<sup>m</sup> 34<sup>s\*</sup> [21, 21<sup>h</sup> 48<sup>m</sup> 34<sup>s</sup>]. Camarines (SE Luzon). Earthquake of intensity V, with subterraneous rumbling. It repeated ten minutes later with less intensity. The shaken area corresponded to the Isarog region, where shocks of small extension occur very frequently.

23, 17<sup>h</sup> 20<sup>m</sup> [24, 1<sup>h</sup> 20<sup>m</sup>]. Catbalogan (W Samar). Earthquake of intensity III, duration 4 seconds.

28, 1<sup>h</sup> 57<sup>m</sup> [28, 9<sup>h</sup> 57<sup>m</sup>]. Baguio (W Luzon). Earthquake shocks of intensity III, duration 6 seconds.

## RECORDS OF THE MICROSEISMOGRAPH.

[Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.62, \epsilon=2.726, \frac{r}{T_0^2}=0.021;$   
 $A_E: T_0=6.03, \epsilon=2.378, \frac{r}{T_0^2}=0.037.$  Alluvium. 2.40 meters above sea level.]

No.	Date.	Character.	Phase.	Hour.	Period.	Amplitude.		Remarks.
						$A_N$ $\mu$	$A_E$ $\mu$	
111	2	IIv	eP L MN ME	0 40 30 41 16 41 34 4 41 34 6			96 71	F overtaken by following earthquake.
112	2	I	e F	0 44 10 2 04				
113	3	Iv	eP F	17 16 48 20				
114	5	I	e F	20 02 19				
115	8	Iv	eP F	15 59 00 16 11				Felt at Butuan (N Mindanao).
116	12	Iv	eP F	0 21 23 45				

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

*Records of the microseismograph—Continued.*

TEMBLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

3, 2<sup>h</sup> 52<sup>m</sup> [3, 10<sup>h</sup> 52<sup>m</sup>]. Camarines (SE de Luzón). Temblor de tierra de intensidad III, sentido en la parte central de la provincia que corresponde a la región del Isarog. Repitió con menos intensidad a 6<sup>h</sup> 7<sup>m</sup> [14<sup>h</sup> 7<sup>m</sup>].

8, 15<sup>h</sup> 59<sup>m</sup> 0<sup>s\*</sup> [8, 23<sup>h</sup> 59<sup>m</sup> 0<sup>s</sup>]. Butúan (N de Mindanao). Temblor de tierra oscilatorio, de intensidad III-IV. Su origen se hallaba probablemente hacia el Océano Pacífico en el Abismo de Filipinas.

12, 12<sup>h</sup> 14<sup>m</sup> 12<sup>s\*</sup> [12, 20<sup>h</sup> 14<sup>m</sup> 12<sup>s</sup>]. Paracale (SE de Luzón). Temblor de tierra de intensidad III, duración 15 segundos.

16, 16<sup>h</sup> 42<sup>m</sup> 24<sup>s\*</sup> [17, 0<sup>h</sup> 42<sup>m</sup> 24<sup>s</sup>]. E de Mindanao. Temblor de tierra de intensidad V, sentido en toda la mitad oriental de la Isla de Mindanao. Su origen se hallaba al E en el Pacífico no lejos de la costa. Fué registrado en todo el Extremo Oriente.

21, 13<sup>h</sup> 48<sup>m</sup> 34<sup>s\*</sup> [21, 21<sup>h</sup> 48<sup>m</sup> 34<sup>s</sup>]. Camarines (SE de Luzón). Temblor de tierra de intensidad V acompañado de ruido subterráneo. Repitió 10 minutos más tarde con menor intensidad. El área afectada fué la región del monte Isarog, donde son frecuentes los temblores de poca extensión, del carácter de hundimiento.

23, 17<sup>h</sup> 20<sup>m</sup> [24, 1<sup>h</sup> 20<sup>m</sup>]. Catbalogan (W de Sámar). Temblor de tierra de intensidad III, duración 4 segundos.

28, 1<sup>h</sup> 57<sup>m</sup> [28, 9<sup>h</sup> 57<sup>m</sup>]. Baguio (W de Luzón). Temblor de tierra de intensidad III, duración 6 segundos.

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

## EARTHQUAKES IN TABLAS ISLAND.

---

On the 27th at  $0^{\text{h}} 22^{\text{m}} 44^{\text{s}}$  \* [27,  $8^{\text{h}} 22^{\text{m}} 44^{\text{s}}$ ] the people of the towns of SW Tablas and NW Panay were startled by violent shocks which caused considerable damage. The ground continued trembling with varying intensity the whole day 27th, and not so strongly but with alarming frequency the 28th and 29th; on the 30th the number of shocks fell considerably. After that date only some few light shocks were daily felt; on the 17th and 19th of May two stronger caused again some panic among the people.

The towns of Tablas where greater damages were caused by the shocks are Odiongo, Looc and Santa Fe, all located to the west or rather southwest portion of the island. From Carabao Island, S of Tablas, some landslides were reported; the shocks retained also an unusual intensity through NW Panay and generally on the whole island.

Mr. Mateo Menez of Odiongo sent the following report of the first shock occurred on the 27th: "It was Sunday morning when the people were beginning to stir up for the day's activities. Some were in the market place bargaining; some on the plaza and streets enjoying the cool morning breeze. A thunder-like sound burst, followed by earth-shocks which caused all bustling people to fall and lay on the ground in prostrated positions. Some that chanced to be near some posts and trees managed themselves to hold on them. The rocking of buildings and trees; the falling of the walls of some houses and the old church made a very confusing noise. Strong concrete buildings were partly damaged. The ground in different parts of the locality cracked and the water in many places sprang from the cracks. Some of the ground cracks are so large and deep that a carabao can be easily buried in them." From the other towns above mentioned similar effects, as those described by M. Menez, were reported by different correspondents.

Among the ignorant people it was rumored that the shocks had some connexion with the recent eruptions of Bulusan Volcano, situated some 200 kilometers away to the east, and there existed not little fear lest some volcano would spring out or the island suddenly sink beneath the sea. These shocks were certainly of geological character as it can be inferred from their great extension and the depth of their origin. Detonative noises are current phenomena in such earthquakes, being produced by the vibrations of the earth, but their audibility depends chiefly on the local composition of the soil.

The extension of the meizoseismic area of the first and strongest earthquake hardly measured a hundred kilometers in the N-S direction, comprising a little more than the southern half of Tablas Island, the group of Carabao Island and perhaps the NW end or peninsula of Panay. In the E-W direction it extended itself certainly much less, having the form of an ellipse prolonged in the direction of the meridian. But the total shaken area, according to the observations at hand seems to have been unusually large and irregular, extending itself abnormally in the direction of the Sulu Sea. Northwards the shock was felt as far as southern and southeastern Luzon, while southeastwards the perceptible waves reached southern Negros, and southwestwards Puerto Princesa, in Palawan Island. Consequently if southern Tablas is taken as a center the shaken area had a radius of about 400 kilometers southwards and only half such extension to the north. Outside of the Archipelago the disturbance was recorded in the Observatories of the Far East and probably also in some of Europe and America, but

at the time of writing this note the records of April had not yet been received. Such distances only by disturbances of geologic character and deep origin are usually reached.

The Island of Tablas seems more apt than other parts of the Philippines to be disturbed by similar shakings, because along its western coast runs one of the main seismotectonic lines which cross the Archipelago. This line probably runs from Batanes Islands, in the north, to the Jolo Archipelago, in the south; along it frequently occur strong and extensive earthquakes, which at times shake W Mindanao, and in other occasions E Luzon or Babuyanes and Batanes Islands. There exist good reasons to believe that the earthquake which occurred on the 21st of last March, and shook severely Marinduque Island and Tayabas Province, was a forerunner or at least it had some connexion with these of Tablas Island. It certainly originated on the same line; had also great extension within the Archipelago and was recorded in the remotest stations of the Far East, leaving not any doubt about its geologic character.

It would be tedious to record here the principal earthquakes of a similar character which originated along the same line, during the last twenty-five years; they are so numerous that it must be considered as very lucky that to the present their centers had remained relatively far from Tablas Island. None of the regions previously affected by such earthquakes has so far sustained any irreparable cataclysm, consequently it is to be expected that no such thing will happen to Tablas Island, although it will be exposed to shocks more or less severe, like other regions placed close to the same line of least resistance.

## LOS TERREMOTOS DE LA ISLA DE TABLAS.

El día 27 a 0<sup>h</sup> 22<sup>m</sup> 44<sup>s</sup>\* [27, 8<sup>h</sup> 22<sup>m</sup> 44<sup>s</sup>] los habitantes de los pueblos del SW de la Isla de Tablas y de la parte NW de Panay fueron sorprendidos por un terremoto destructor que causó bastantes ruinas. La tierra continuó luego temblando con mucha frecuencia y varia intensidad todo el 27, el 28 y 29; el 30 amainaron las sacudidas y después ya no se repitieron sino raras veces al día y con poca intensidad; en dos ocasiones sin embargo su fuerza volvió a causar zozobra y esto fué el 17 y el 19 de mayo.

Los pueblos que sufrieron mayores daños son los de Odiongo, Looc y Santa Fé situados todos al W o mejor al SW de la Isla de Tablas. También se ha dicho que hubo desprendimientos en la Isla de Carabao situada al S; además consta que en la parte NW de la Isla de Panay tuvo el terremoto una intensidad extraordinaria y que dió mucho que temer, conservando también grande energía en toda la Isla de Panay.

El Sr. Mateo Menez de Odiongo hace del terremoto principal del día 27 la siguiente descripción: "Era la mañana de un domingo y la gente comenzaba a moverse para los quehaceres del día. Muchos estaban en el mercado ocupados en sus compras, otros en la plaza y en las calles disfrutando de la brisa matinal. Un estampido semejante a un trueno y violentas sacudidas derribaron al suelo la mayor parte de la gente en movimiento, caídos unos y postrados instintivamente otros para no caerse; los que por casualidad hallaron a mano algún árbol o poste se agarraron a ellos. Los vaivenes de los edificios y de los árboles y el derrumbarse de los muros de algunas casas y de la vieja iglesia producían un ruido ensordecedor. Algunas construcciones de cemento armado quedaron también con daños parciales. La tierra se agrietó en diferentes partes de la población, con salida de agua de las grietas; algunas de éstas eran tan anchas y profundas que pudiera enterrarse en ellas un carabao." De los otros pueblos citados se recibieron noticias, respecto del carácter y efectos del terremoto, semejantes a las dadas por el Sr. Menez.

La opinión del vulgo era que estos terremotos tenían alguna conexión con las erupciones del Volcán Bulusan, situado a más de 200 kilómetros de distancia, temiendo no apareciese un volcán en la isla o se hundiese repentinamente. Mas el terremoto era ciertamente de carácter geológico o tectónico como lo demuestran su grande extensión y la profundidad de su origen. Los ruidos, a veces semejantes al trueno y también a explosiones, se consideran como efecto natural de las vibraciones producidas en el terreno y así su audibilidad y naturaleza depende de la composición local de las capas terrestres.

La extensión del área mezosímica no parece llegase a tener 100 kilómetros en dirección N-S, comprendiendo algo más de la mitad meridional de la Isla de Tablas, la Isla Carabao y tal vez el extremo o península NW de Panay. En el rumbo E-W era sin duda muy limitada, afectando por consiguiente la forma de una elipse muy prolongada en la dirección N-S. Con todo la extensión total del terremoto fué extraordinariamente grande e irregular, prolongándose desmesuradamente en dirección al Mar de Joló. Por los datos existentes se ve que mientras hacia el N y NE solamente llegó a ser perceptible en la parte meridional y sudeste de Luzón, por la parte sur y sudoeste del epicentro tuvo grande intensidad en toda la Isla de Panay y fué perceptible en Negros y Puerto Princesa; por manera que tomando como centro la parte sur de Tablas el área conmovida

tenía un radio de hasta 400 kilómetros por el S y SW y casi la mitad por el N y NE. Fuera del Archipiélago registraronlo los sismógrafos de todo el Extremo Oriente y quizá también algunos de Europa y América, de donde al tiempo de escribir esta nota no han llegado aún observaciones. A tales distancias únicamente los terremotos de carácter geológico y de muy profundo origen suelen registrarse.

La Isla de Tablas está tanto o tal vez más expuesta a terremotos geológicos que otras muchas partes de Filipinas; frente a su costa occidental y no lejos de ella corre una de las líneas sismotectónicas más importantes del Archipiélago, la cual se extiende desde las Islas Batanes hasta el Archipiélago de Joló. A lo largo de esta línea se originan con frecuencia terremotos intensos que afectan unas veces la parte W de Mindanao, otras el E de Luzón y otras las Babuyanes y Batanes. Todo hace creer que el terremoto del 21 de marzo último, sentido con mucha intensidad en Marinduque y en la Provincia de Tayabas, debe considerarse como precursor o por lo menos intimamente relacionado con los de la Isla de Tablas. Originado en la misma línea pero más al N, tuvo también grande extensión dentro del Archipiélago y sus ondas se registraron en todo el Extremo Oriente, no permitiendo esto dudar de su carácter geológico.

Largo sería enumerar siquiera los principales terremotos de semejante carácter originados a lo largo de la mencionada línea durante los últimos veinticinco años; por una coincidencia feliz sus epicentros habían hasta ahora quedado algo lejos de la Isla de Tablas. Como ninguna de las regiones afectadas por dichos terremotos ha sufrido cataclismos o hundimientos irreparables, tampoco es de temer suceda a la región de Tablas, aunque, a semejanza de otros sitios de la misma línea de menor resistencia, por fuerza estará expuesta de tiempo en tiempo a terremotos de mayor o menor importancia.

## **BULLETIN FOR MAY, 1919.**

---

# METEOROLOGICAL BULLETIN FOR MAY, 1919.

BY REV. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure for this month in the Philippines differs very little both from that of last year and from the normal of May. The highest pressures of the month were reported by all the stations on the 5th, while the lowest pressure were generally observed on the 28th and 29th in Mindanao, the Visayas, central and southern Luzon, and on the 18th in northern Luzon.

The mean monthly temperature is slightly above the normal, and above the monthly mean of the preceding year, in all our stations with the exception of those in the northernmost part of Luzon. The highest and lowest monthly temperatures for Manila were 37.7° C. and 21.1° C.: they were registered on the 12th and 1st, respectively. The extreme temperatures for Baguio were 27.3° C., 15.2° C. on the top of Mirador, and 27.1° C., 14.8° C. in the valley.

Only three times since 1880 had Manila Observatory recorded in May a maximum temperature higher than that of this year: it was in May, 1889, 1912 and 1915. And only three times more during the same period of 40 years, namely in May, 1891, 1906 and 1914, had the maximum May temperature of Manila been higher than 37.5° C.

\* 23 days of observation only.

<sup>b</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—There was still a lack of rain during this month in the Philippines, but more particularly in Mindanao, the Visayas and the southern part of Luzon, and during the first ten days of the month. Although in Manila there was no rain at all from the

1st to the 12th of the month, yet the thundershowers which visited the city several times after the 12th caused the total monthly rainfall to be 61 mm. above that of the preceding year, and 38.7 mm. above the May's normal. The rain in Baguio was even more abundant than in Manila, the monthly total being 230.0 mm. greater than that of May, 1918, and 31.1 mm. greater than the normal of this month.

DAILY RAINFALL AT VARIOUS STATIONS OF THE WEATHER BUREAU DURING THE MONTH OF MAY, 1919.

## DEPRESSIONS AND TYPHOONS.

There was no depression or typhoon during this month near the Philippines: and even in the whole Far East there were only some depressions, which belong rather to the type of Continental depressions and were formed above 25° latitude, either in the Eastern Sea or between the Bonins and the Loochoos, and moved eastward or northeastward to the south of Japan.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes en Filipinas difiere muy poco de la del año pasado y de la normal de mayo. Las presiones más altas del mes se registraron en todas las estaciones el día 5, mientras que las más bajas se observaron generalmente los días 28 y 29 en Mindanao, Visayas y en el centro y sur de Luzón, y el 18 en norte de Luzón.

La temperatura media mensual es ligeramente mayor que la normal, y mayor que la media de mayo del año pasado en todas nuestras estaciones a excepción de las de la parte más septentrional de Luzón. Las temperaturas máxima y mínima absolutas del mes en Manila fueron  $37.7^{\circ}$  C. y  $21.1^{\circ}$  C., las cuales se registraron los días 12 y 1, respectivamente. Las temperaturas extremas de Baguio fueron  $27.3^{\circ}$  C.,  $15.2^{\circ}$  C. en la cumbre del Mirador, y  $27.1^{\circ}$  C.,  $14.8^{\circ}$  C. en el valle.

Solo tres veces desde 1880 ha registrado el Observatorio de Manila una temperatura máxima mayor que la de este año, y fué en mayo de 1889, 1912 y 1915. Y solo tres veces más durante el mismo período de 40 años, a saber, en mayo de 1891, 1906 y 1914, la temperatura máxima de Manila en mayo ha sido mayor de  $37.5^{\circ}$  C.

**Precipitación acuosa.**—Se sintió aún escasez de lluvia durante este mes en Filipinas, pero más particularmente en Mindanao, Visayas y en la parte meridional de Luzón, y durante los diez primeros días del mes. En Manila, aunque no hubo lluvia alguna desde el día 1 hasta el 12 del mes, con todo, debido a los chubascos de turbonada que varias veces se repitieron después del día 12, la lluvia total de este mes es mayor que la del año pasado en 61 mm., y que la normal de mayo en 38.7 mm. La lluvia en Baguio fué aún más abundante que en Manila, siendo la cantidad total del mes mayor en 230.0 mm. que la de mayo de 1918, y en 31.1 mm. que la normal de este mes.

## DEPRESIONES Y TIFONES.

Durante este mes no hubo depresión o tifón cerca de Filipinas, y aún en todo el Extremo Oriente sólo hubo algunas depresiones que pertenecen más bien al tipo de las depresiones continentales y que se formaron en latitudes más altas de  $25^{\circ}$ , bien en el Mar del Este, bien entre las Islas Bonins y Loochoos, y se movieron hacia el E o NE por el S de Japón.

METEOROLOGICAL DATA FOR MANILA CENTRAL OBSERVATORY.<sup>a</sup>[ $\Phi = 14^\circ 34' 41'' \text{ N}$ ;  $\lambda = 120^\circ 58' 33'' \text{ E}$ ; barometer above sea, 14.2 meters; gravity correction not applied, —1.72 mm.]

<sup>a</sup> All the mean values given in this table are deduced from six daily observations taken at 2, 6, 10 a.m. and 2, 6, 10 p.m.<sup>b</sup> The barometric readings of this station are not reduced to sea level.<sup>c</sup> Maximum of hourly observations taken from 6 a.m. to 6 p.m.<sup>d</sup> This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

## SEISMOLOGICAL BULLETIN FOR MAY, 1919.

By REV. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

4, 22<sup>h</sup> 1<sup>m</sup> 49<sup>s</sup>\* [5, 6<sup>h</sup> 1<sup>m</sup> 49<sup>s</sup>]. N Luzon and Batanes. Extensive earthquake of intensity IV–V. Its epicenter apparently lay in the vicinity of Balintang Channel: the greater intensity experienced at Aparri, NE Luzon, than at Santo Domingo, Batan Island, seems to be due to local conditions of the soil. In Batanes Islands there was felt an aftershock on the 5th at 14<sup>h</sup> 15<sup>m</sup> [22<sup>h</sup> 15<sup>m</sup>] and a second light shock on the 6th at 12<sup>h</sup> 45<sup>m</sup> [20<sup>h</sup> 45<sup>m</sup>] not noticed in northern Luzon, nor recorded at the Observatory.

5, 12<sup>h</sup> 25<sup>m</sup> [5, 20<sup>h</sup> 25<sup>m</sup>]. Irosin (SE Luzon). Earthquake of intensity V in the region around Bulusan Volcano. The very local character of this sharp and long earthquake, felt only close to the volcano, places the shock among the actual indications of activity of the said volcano.<sup>2</sup>

6, 19<sup>h</sup> 48<sup>m</sup> 27<sup>s</sup>\* [7, 3<sup>h</sup> 48<sup>m</sup> 27<sup>s</sup>]. Butuan (N Mindanao). Earthquake of intensity II–III. The origin lay far away in the Pacific Ocean: it was recorded through the Far East and in the American Observatories.

15, 18<sup>h</sup> 30<sup>m</sup> [16, 2<sup>h</sup> 30<sup>m</sup>]. Masbate Island. Earthquake of intensity IV, duration 8 seconds. It was also felt in the western part of Sorsogon Province.

21, 23<sup>h</sup> 46<sup>m</sup> 19<sup>s</sup>\* [22, 7<sup>h</sup> 46<sup>m</sup> 19<sup>s</sup>]. E Mindanao. Earthquake shocks felt with intensity III around Davao Gulf and only II–III through the Agusan Valley. Its origin seems to have been off the SE coast of Mindanao.

24, 5<sup>h</sup> 45<sup>m</sup> 28<sup>s</sup>\* [24, 13<sup>h</sup> 45<sup>m</sup> 28<sup>s</sup>]. Camiguin Island. (N of Mindanao). Earthquake of intensity III, recorded also at Butuan. The epicenter lay probably in the sea W of Camiguin.

25, 11<sup>h</sup> 39<sup>m</sup> 21<sup>s</sup>\* [25, 19<sup>h</sup> 39<sup>m</sup> 21<sup>s</sup>]. Samar and Leyte. Extensive earthquake felt with intensity IV–V through SE Samar, and III in the rest of this island, the Island of Leyte and SE Luzon. Origin in the Philippine Deep.

31, 0<sup>h</sup> 19<sup>m</sup> 55<sup>s</sup>\* [31, 8<sup>h</sup> 19<sup>m</sup> 55<sup>s</sup>]. Baguio (W Luzon). Oscillatory earthquake, intensity III, short duration: originated probably to the NE within the Mountain Province.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight-0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

<sup>2</sup> See Bulletin of January, 1919.

## RECORDS OF THE MICROSEISMOGRAPH.

[Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.62, \epsilon=2.726, \frac{r}{T_0^2}=0.021;$   
 $A_E: T_0=6.03, \epsilon=2.378, \frac{r}{T_0^2}=0.037.$  Alluvium. 2.40 meters above sea level.]

TEMBLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

4, 22<sup>h</sup> 1<sup>m</sup> 49<sup>s</sup>\* [5, 6<sup>h</sup> 1<sup>m</sup> 49<sup>s</sup>]. N de Luzón y Batanes. Extenso temblor de tierra de intensidad IV-V. Su epicentro parece se hallaba cerca del Canal de Balintang; el haberse sentido con más intensidad en Aparri, NE de Luzón, que en Santo Domingo de Batanes puede ser efecto de las condiciones locales. En Batanes se percibió una repetición a 14<sup>h</sup> 15<sup>m</sup> [22<sup>h</sup> 15<sup>m</sup>] del 5 y otro temblorcillo a 12<sup>h</sup> 45<sup>m</sup> [20<sup>h</sup> 45<sup>m</sup>] del 6 no sentidos al N de Luzón ni registrados en Manila.

5, 12<sup>h</sup> 25<sup>m</sup> [5, 20<sup>h</sup> 25<sup>m</sup>]. Irosin (SE de Luzón). Temblor de tierra de intensidad V en la región del volcán Bulusan. Su carácter local, puesto que solo se sintió en las cercanías del volcán, indica que debe considerarse como una de las manifestaciones de la presente actividad de dicho volcán.<sup>2</sup>

6, 19<sup>h</sup> 48<sup>m</sup> 27<sup>s</sup>\* [7, 3<sup>h</sup> 48<sup>m</sup> 27]. Butúan (N de Mindanao). Temblor de tierra de intensidad II-III. El origen se hallaba muy lejos en el Pacífico y fué registrado en todo el Extremo Oriente y en América.

15, 18<sup>h</sup> 30<sup>m</sup> [16, 2<sup>h</sup> 30<sup>m</sup>]. Isla de Masbate. Temblor de intensidad IV, duración 8 segundos. Sintióse también en la parte W de la Provincia de Sorsogón.

21, 23<sup>h</sup> 46<sup>m</sup> 19<sup>s</sup>\* [22, 7<sup>h</sup> 46<sup>m</sup> 19<sup>s</sup>]. E de Mindanao. Temblor de tierra sentido con intensidad III en el seno de Dávao y solo II-III en el Valle del Agusan; originado algo lejos en el Pacífico al E de Dávao.

24, 5<sup>h</sup> 45<sup>m</sup> 28<sup>s</sup>\* [24, 13<sup>h</sup> 45<sup>m</sup> 28<sup>s</sup>]. Camiguín (N de Mindanao). Temblor de tierra de intensidad III. Registrado también en Butúan; su epicentro se hallaba en el mar, probablemente al W de la Isla de Camiguín.

25, 11<sup>h</sup> 39<sup>m</sup> 21<sup>s</sup>\* [25, 19<sup>h</sup> 39<sup>m</sup> 21<sup>s</sup>]. Sámar y Leyte. Extenso temblor de tierra sentido con intensidad IV-V en la parte SE de Sámar y III en el resto de la Isla, en Leyte y en el extremo SE de Luzón. El epicentro se hallaba en el Abismo de Filipinas en el Pacífico.

31, 0<sup>h</sup> 19<sup>m</sup> 55<sup>s</sup>\* [31, 8<sup>h</sup> 19<sup>m</sup> 55<sup>s</sup>]. Baguio (W de Luzón). Temblor oscilatorio, intensidad III, duración corta; el origen se hallaba probablemente hacia el NE, dentro de la Provincia Montañosa.

---

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

## **BULLETIN FOR JUNE, 1919.**

# METEOROLOGICAL BULLETIN FOR JUNE, 1919.

BY REV. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure for this month is slightly below the June's normal. The highest pressures were generally observed on the 22nd or 29th, while the lowest were recorded on the 30th in Mindanao and the southern Visayas, and on the 9th and 10th in the northern Visayas and Luzon.

The mean monthly temperature is slightly above that of the preceding year, but almost identical with the normal of June. The absolute maximum and minimum temperatures for Manila were 35.0° C. and 22.9° C.: they were registered on the 1st and 3rd, respectively. The extreme temperatures for Baguio were 25.4° C., 15.7° C. on the top of Mirador, and 26.0° C., 15.1° C. in the valley.

### PRESSURE AND TEMPERATURE AT THE FIRST AND SECOND CLASS STATIONS FOR JUNE, 1919.

<sup>a</sup> 26 days of observation. <sup>b</sup> 21 days of observation. <sup>c</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—In the great majority of our stations the total rainfall for this month is greater than that of June, 1918, and in a good number of them it is greater also than the normal of this month. In the northern part of Luzon, however, there was rather a lack of rain, almost all the stations giving a monthly total below that of June, 1918, and below the normal. Thus the monthly rainfall for Baguio was only 300.9 mm., an amount which differs from the normal of June by — 90.1 mm. The total rainfall for Manila is 41.0 mm. above that of the preceding year, and 31.0 mm. above the normal.

## DEPRESSIONS AND TYPHOONS.

Only one typhoon crossed the Philippine Islands during this month. We shall presently say a few words on its track. Besides this, there was another depression or typhoon of little importance which moved NW over the Pacific to the east of Luzon, on the 24th to 26th, and filled up probably to the east of Balintang Channel. Simultaneously another depression seems to have formed over the China Sea on the 26th, moving probably westward north of Paracels, and filling up on the 28th near Hainan.

The "Vicentica" typhoon.—We call this typhoon the *Vicentica* typhoon because it caused the complete wreck of a small steamer bearing this name, off the western coast of Sorsogon. Although the observations from Yap gave slight indications of a depression or typhoon to the south and southwest on the 3rd and 4th, yet the track of this typhoon can be given only as probable up to the 8th when it began to influence clearly the barometers of the Philippines. The center of the typhoon was situated at 6 a. m. of that day to the E of Samar, in about 127° longitude E and 11° latitude N moving WNW.

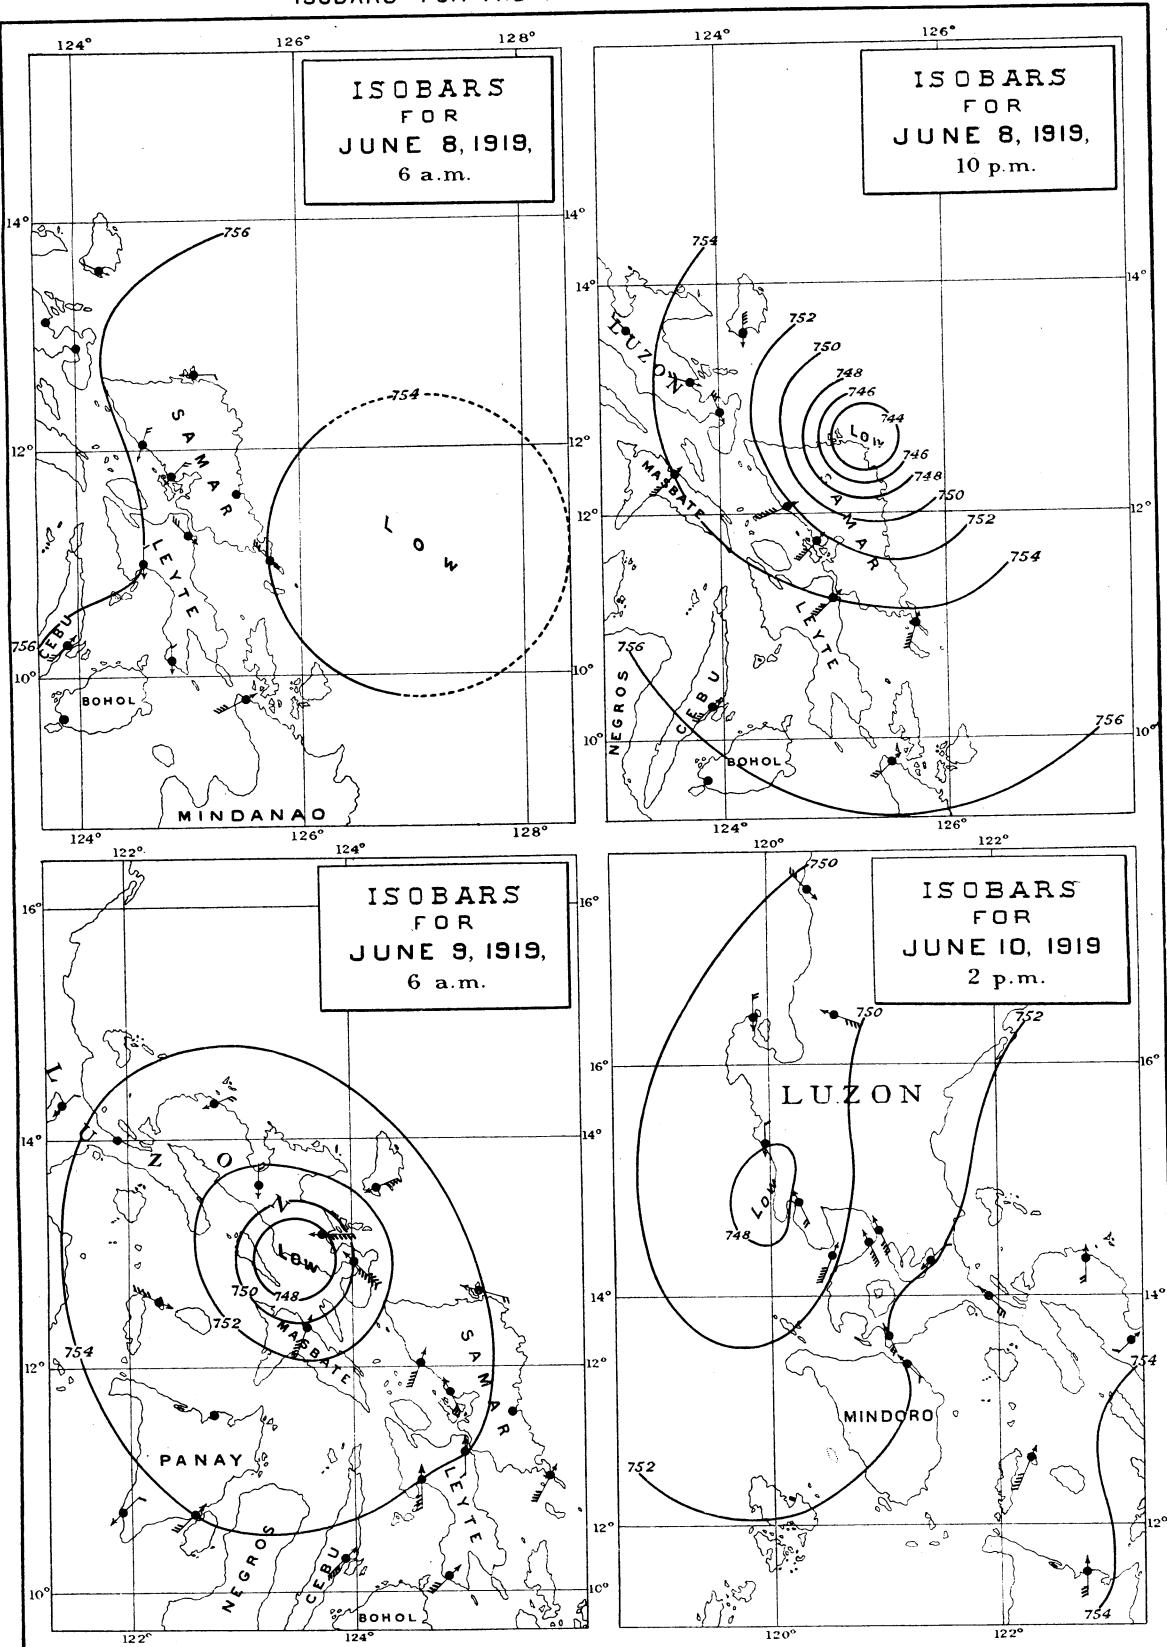

This typhoon was rather a small typhoon and changed its direction three or four times while in or near the Philippines. On the 8th it inclined northward moving NW in the afternoon of that day until 10 p. m., when it began to move almost due west. From 6 a. m. until 2 p. m. of the 9th it moved again northwestward; then it took an WNW direction until 2 p. m. of the 10th, when it moved for the third time northwestward in the China Sea west of Luzon.

The typhoon was quite intense when it traversed the province of Sorsogon in the early morning of the 29th; but it decreased in intensity later, so that there were hardly any destructive effects in Manila or in Cavite, although the cyclonic center passed a very few miles from both places. The lowest barometric minima recorded during this typhoon were those of Batag and Sorsogon. That of Batag was 742.5 mm. at 10.50 p. m. of the 8th. The minimum of Sorsogon was 741.22 mm. or possibly lower. We say that

## ISOBARS FOR THE TYPHOON OF JUNE, 1919.

Plate III.

N.B.—The barometric readings have been reduced to standard gravity.

it was possibly lower, because no observation was made from 2 to 3.30 a. m. when the above mentioned reading was taken with winds blowing with hurricane force from ENE.

Other less important barometric minima were as follows: Atimonan, 747 mm., 10th, 1 a. m.; Naga, 747.6 mm., 9th, noon; Legaspi, 748.6 mm., 8th, 3.15 a. m.; Manila, 749.3 mm., 10th, 9 a. m.

The following are the typhoon warnings sent by Manila Observatory on this typhoon:

June 8, 11.50 a. m.: There is a small depression or typhoon to the east of the Visayas; its actual direction cannot yet be ascertained.

June 8, 5.45 p. m.: The Pacific typhoon is situated this afternoon near Samar moving probably NW or NNW.

June 9, 8.30 a. m.: The typhoon seems to have inclined westward since yesterday evening. Its center was probably situated at 6 a. m. to-day in the neighborhood of southeastern Luzon.

June 9, 6 p. m.: The typhoon seems to be situated this afternoon over the southernmost part of Luzon to the southeast of Atimonan; it has been moving since 6 a. m. W by N.

June 10, 6 a. m.: The small typhoon is probably situated at present about 40 miles to the SE of Manila, crossing the southern part of Laguna Province moving W by N or WNW.

June 10, 8 a. m.: The typhoon is probably situated in the neighborhood of Laguna Province and may pass near Manila this morning.

June 10, 9.30 a. m.: It seems that the small typhoon has just passed between Cavite and Manila. Its center appears to be somewhat deformed and its track may be inclining again northward.

June 10, 11.30 a. m.: The small typhoon is now in the Manila Bay moving apparently NW by W or WNW, it having inclined again somewhat to the N since yesterday.

June 11, 11.50 a. m.: The small typhoon seemed to be situated at 6 a. m. to-day in the China Sea about 100 miles to the west of Bolinao; it has probably inclined somewhat more to the north since yesterday afternoon.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes es ligeramente menor que la normal de junio. Las presiones más altas se observaron generalmente el día 22 o el 29, mientras que las más bajas se registraron el día 30 en Mindanao y en el S de Visayas, y los días 9 y 10 en el N de Visayas y en Luzón.

La temperatura media de este mes es ligeramente mayor que la del año pasado, pero casi igual a la normal de junio. Las temperaturas máxima y mínima absolutas del mes en Manila fueron  $35.0^{\circ}$  C. y  $22.9^{\circ}$  C., las cuales se registraron los días 1 y 3, respectivamente. Las temperaturas extremas de Baguio fueron  $25.4^{\circ}$  C.,  $15.7^{\circ}$  C. en la cumbre del Mirador, y  $26.0^{\circ}$  C.,  $15.1^{\circ}$  C. en el valle.

**Precipitación acuosa.**—En la gran mayoría de nuestras estaciones la lluvia total de este mes supera a la de junio de 1918, y en buen número de ellas supera también a la normal de este mes. En la parte septentrional de Luzón, sin embargo, hubo más bien escasez de lluvia, habiendo registrado casi todas las estaciones un total mensual menor que el de junio de 1918, y menor también que la normal de este mes. Así la lluvia total del mes en Baguio fué sólo 300.9 mm., cantidad que difiere de la normal de junio en — 90.1 mm. La lluvia total del mes en Manila es mayor que la del año pasado en 41.0 mm., y mayor también que la normal en 31.0 mm.

## DEPRESIONES Y TIFONES.

Durante este mes un solo tifón cruzó las Islas Filipinas. En los siguientes párrafos diremos unas cuantas palabras sobre su trayectoria. Además de este tifón, hubo una depresión o tifón de poca importancia que se movió al NW en el Pacífico al E de Luzón del 24 al 26, y se deshizo probablemente al E del Canal de Balintang. Simultáneamente parece haberse formado otra depresión en el Mar de China el día 26, moviéndose probablemente al W por el N de Paracels, y deshaciéndose el día 28 cerca de Hainán.

**El tifón del "Vicentica."**—Llamamos a este tifón el tifón del *Vicentica*, por haber causado el total naufragio de un pequeño barco de este nombre, cerca de la costa occidental de Sorsogón. Aunque las observaciones de Yap dan ligeras indicaciones sobre una depresión o tifón situado al S o SW de dicha estación los días 3 y 4, con todo, sólo puede darse como probable la trayectoria de este tifón hasta el día 8 en que empezó a influir claramente en los barómetros de Filipinas. El centro de este tifón se hallaba a las 6 a. m. de dicho día al E de Sámar, en los alrededores de  $127^{\circ}$  longitud E y  $11^{\circ}$  latitud N, moviéndose al WNW.

Este fué más bien un tifón de pequeñas dimensiones y cambió su trayectoria tres o cuatro veces mientras se hallaba en, o cerca de, Filipinas. El día 8 se inclinó al N, moviéndose al NW la tarde de aquel día hasta 10 p. m., cuando empezó a dirigirse casi directamente al W. Desde 6 a. m. hasta 2 p. m. del día 9 se movió de nuevo al NW; luego se dirigió al WNW hasta 2 p. m. del día 10, cuando por tercera vez se movió al NW en el Mar de China al W de Luzón.

El tifón era bastante intenso mientras atravesaba la Provincia de Sorsogón la madrugada del día 9; pero disminuyó luego en intensidad, y así apenas produjo efectos destructores en Manila o en Cavite, aun cuando el centro ciclónico pasó a muy pocas millas de ambos lugares. Las mínimas barométricas más bajas registradas durante el paso de este tifón fueron las de Batag y Sorsogón. La de Batag fué 742.5 mm. y tuvo lugar a las 10.50 p. m. del día 8. La mínima barométrica de Sorsogón fué 741.22 mm., y probablemente aún más baja. Decimos que probablemente fué aún más baja, porque ninguna observación se hizo desde 2 hasta 3.30 a. m. en que se tomó la lectura arriba mencionada con vientos que soplaban con fuerza huracanada del ENE.

Otras mínimas barométricas de menos importancia son como siguen: Atimonan,

747 mm., a 1 a. m. del día 10; Naga, 747.6 mm., a mediodía del 9; Legaspi, 748.6 mm., a 3.15 a. m. del 8; Manila, 749.3 mm. a 9 a. m. del día 10.

Sobre este temporal el Observatorio de Manila expidió los siguientes avisos de tifón:

Junio 8, 11.50 a. m.: Existe una pequeña depresión o tifón al E de Visayas; su dirección actual no se puede aún precisar.

Junio 8, 5.45 p. m.: El tifón del Pacífico se halla esta tarde cerca de Sámar, moviéndose probablemente al NW o NNW.

Junio 9, 8.30 a. m.: El tifón parece haberse inclinado hacia el W desde ayer noche. Su centro se hallaba probablemente a las 6 a. m. de hoy en los alrededores del SE de Luzón.

Junio 9, 6 p. m.: El tifón parece hallarse esta tarde en el extremo S de Luzón al SE de Atimonan; se ha movido desde 6 a. m. al W $\frac{1}{4}$ NW.

Junio 10, 6 a. m.: El pequeño tifón se halla probablemente a unas 40 millas al SE de Manila, atravesando la parte meridional de la Provincia de La Laguna, moviéndose al W $\frac{1}{4}$ NW o WNW.

Junio 10, 8 a. m.: El tifón se halla probablemente en los alrededores de la Provincia de La Laguna y es posible que pase cerca de Manila esta mañana.

Junio 10, 9.30 a. m.: Parece que el pequeño tifón acaba de pasar entre Cavite y Manila. Su centro aparece algo deformado y es posible que su trayectoria se esté inclinando de nuevo hacia el N.

Junio 10, 11.30 a. m.: El pequeño tifón se halla ahora en la bahía de Manila, moviéndose aparentemente al NW $\frac{1}{4}$ W o WNW, habiéndose inclinado ligeramente de nuevo al N desde ayer.

Junio 11, 11.50 a. m.: El pequeño tifón se hallaba probablemente a las 6 a. m. de hoy en el Mar China a unas 100 millas al W de Bolinao; parece que se ha inclinado algo más al N desde ayer tarde.

<sup>a</sup> All the mean values given in this table are deduced from six daily observations taken at 2, 6, 10 a. m. and 2, 6, 10 p. m.<sup>b</sup> The barometric readings of this station are not reduced to sea level.<sup>c</sup> Maximum of hourly observations taken from 6 a. m. to 6 p. m.<sup>d</sup> This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

## SEISMOLOGICAL BULLETIN FOR JUNE, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

4, 6<sup>h</sup> 0<sup>m</sup> [4, 14 0<sup>m</sup>]. Port Lebak (SW Mindanao). Earthquake shock of intensity IV.  
4, 11<sup>h</sup> 10<sup>m</sup> 56<sup>s\*</sup> [4, 19<sup>h</sup> 10<sup>m</sup> 56<sup>s</sup>]. Cape Bojeador (NW Luzon). Earthquake of intensity III-IV. Lesser aftershock at 13<sup>h</sup> 40<sup>m</sup> (21<sup>h</sup> 40<sup>m</sup>).

5, 17<sup>h</sup> 51<sup>m</sup> 40<sup>s\*</sup> [6, 1<sup>h</sup> 51<sup>m</sup> 40<sup>s</sup>]. W Mindanao. Earthquake of intensity V-VI, originated in the Celebes Sea between Zamboanga and Cotabato. It was felt through the districts of Zamboanga, Lanao and Cotabato facing to the Illana, Dumanquilas and Sibuguey bays.

13, 8<sup>h</sup> 55<sup>m</sup> 29<sup>s\*</sup> [13, 16<sup>h</sup> 55<sup>m</sup> 29<sup>s</sup>]. SE Luzon, Samar and Leyte. Extensive earthquake felt in the provinces of Camarines, Albay, Sorsogon, Catanduanes and the islands of Samar and Leyte. Its intensity did not exceed grade IV; the epicenter seems to have been in the Pacific, NE of San Bernardino Strait.

13, 17<sup>h</sup> 30<sup>m</sup> [14, 1<sup>h</sup> 30<sup>m</sup>]. Ambos Camarines (SE Luzon). Earthquake of intensity III felt only in the Isarog region.

14, 20<sup>h</sup> 51<sup>m</sup> [15, 4<sup>h</sup> 51<sup>m</sup>]. Butuan (N Mindanao). Oscillatory earthquake, direction NE-SW, intensity III, duration 8 seconds.

15, 14<sup>h</sup> 37<sup>m</sup> 32<sup>s\*</sup> [15, 22<sup>h</sup> 37<sup>m</sup> 32<sup>s</sup>]. W Mindanao. Extensive earthquake originated in the Celebes Sea, very likely close to the epicenter of the shocks occurred on the 5th. It also shook with intensity IV-V the same portions of Zamboanga, Lanao and Cotabato districts.

20, 13<sup>h</sup> 25<sup>m</sup> 12<sup>s\*</sup> [20, 21<sup>h</sup> 25<sup>m</sup> 12<sup>s</sup>]. Aparri (NE Luzon). Oscillatory earthquake, direction E-W, intensity IV, duration 7 seconds.

21, 11<sup>h</sup> 06<sup>m</sup> 35<sup>s\*</sup> [21, 19<sup>h</sup> 06<sup>m</sup> 35<sup>s</sup>]. Leyte Island. Earthquake of intensity III, felt also in northern Cebu. The epicenter was S of Masbate Island.

22, 7<sup>h</sup> 30<sup>m</sup> [22, 15<sup>h</sup> 30<sup>m</sup>]. Ormoc (W Leyte). Oscillatory earthquake, direction W-E, intensity III, duration 11 seconds.

22, 16<sup>h</sup> 18<sup>m</sup> 4<sup>s\*</sup> [23, 0<sup>h</sup> 18<sup>m</sup> 4<sup>s</sup>]. W Luzon. Earthquake of intensity III, reported only from Dagupan and Cape Bojeador. Its epicenter lay in the China Sea some distance from the Luzon coasts. Due to the distance of the center, the slowness of the waves did not awake the people of the two provinces along the coast, between Dagupan and Cape Bojeador, nearer to the origin of the shock.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>) insular time being added in brackets for the convenience of the Philippine readers.

24, 19<sup>h</sup> 36<sup>m</sup> [25, 3<sup>h</sup> 36<sup>m</sup>]. Zamboanga (W Mindanao). Oscillatory earthquake, direction NE-SW, intensity III, duration 5 seconds. Recorded at Butuan by a seismograph.

• 30, 21<sup>h</sup> 23<sup>m</sup> 41<sup>s\*</sup> [July 1, 5<sup>h</sup> 23<sup>m</sup> 41<sup>s</sup>]. Panay and Negros Islands. Earthquake shock of intensity III, felt in the Provinces of Iloilo and Negros Occidental. The epicenter lay in the strait, S of Guimaras Island.

From Tablas Island, where a very alarming seismic period began last April, some few shocks were reported: they occurred on the 17th and 19th at about 15<sup>h</sup>; on the 28th at 21<sup>h</sup> and on the 30th in the afternoon.<sup>1</sup>

#### SEISMIC PERIOD OF ILOCOS SUR.

This short period began on the 20th of June, reached its maximum and ended on the 25th with a succession of shocks which greatly alarmed the people of Vigan and the towns, south of this city.

The first shock of the series occurred on the 20th at 12<sup>h</sup> 46<sup>m</sup> 44<sup>s\*</sup> [I. T.]. It shook the Ilocos Sur Province with intensity III-IV. The earth vibrations seem to have propagated themselves very irregularly through the neighboring provinces, it depending on the geological conditions of the soil; thus while the shock was fairly perceptible at Sagada, Bontoc, east of the epicenter, and at Aparri far away to the NE, many other nearer stations did not report any disturbance. Similar irregularity was noticed with other shocks of the series.

On the 21st at 6<sup>h</sup> 50<sup>m</sup> 01<sup>s\*</sup> occurred a second shock of minor intensity felt only within the Province of Ilocos Sur. The seismographs at Manila and Baguio had recorded also another light shock from the same origin at 5<sup>h</sup> 33<sup>m</sup> 37<sup>s\*</sup>.

During the days 22nd, 23rd and 24th no perceptible shock occurred, but the seismographs of Baguio recorded two small disturbances probably originated at Ilocos.

Early on the 25th, the strain accumulated possibly during several years reached its utmost. At 2<sup>h</sup> 35<sup>m</sup> 21<sup>s\*</sup> an earthquake of intensity VI-VII startled the inhabitants of Vigan and the towns of the vicinity and of the southern part of the province. During long fifteen seconds they were afraid lest the stone buildings with tile roofs, peculiar of the city of Vigan, would fall yielding to the terrible shocks. Fortunately only few roofs were damaged and some walls cracked.

The meizoseismic area of this earthquake comprised the region of Vigan and the southern coastal region to a distance of about 50 kilometers, but its extension inland or eastwards was very small. Yet the shocks were fairly felt through the whole island north of the 16.5° parallel.

A circumstance which greatly alarmed the people was a succession of shocks not so strong as the first but sufficiently perceptible to fear a worse earthquake. These repetitions occurred at 3<sup>h</sup> 37<sup>m</sup> 19<sup>s\*</sup>, 3<sup>h</sup> 53<sup>m</sup> 27<sup>s\*</sup>, 5<sup>h</sup> 8<sup>m</sup> 32<sup>s\*</sup> and 7<sup>h</sup> 18<sup>m</sup> 38<sup>s\*</sup>. After this last shock as if the strain would have been sufficiently released the disturbance ended so completely that not a single of the numerous shocks recorded the following days to the end of the month by the seismographs of Manila and Baguio could be traced to the Ilocos center. Outside of the Archipelago only the principal shock after two o'clock was recorded at Formosa and Batavia.

This seismic period can be considered as a confirmation of the statement made in 1909 about the existence of a local and shallow seismic center along the coast of Ilocos Sur, extending roughly from Vigan to Candon, which might be called the Abra gap center. The configuration of the Abra gap, as well as the previous northerly course of the river, and the character of the western cordillera show that there exist much faulting and give an idea of great ancient convulsions, which have yet an echo in the lesser

---

<sup>1</sup> See Bulletin for April 1919.

shocks of the present time. It seems very likely that the western cordillera by reason of faulting in the Abra gap and along the Abra river form a nearly independent tectonic block extending southwards about a hundred kilometers the more or less unstable condition of which give rise to frequent tectonic shocks of rockfall character. In the Bulletin for May, 1909, in a review of the Ilocos shocks the conclusion was reached of the existence of a seismic epicenter along or very near to the coast of Ilocos Sur, approximately located between  $17^{\circ}$  and  $17.5^{\circ}$  N. Lat. This region nearly coincides with the meizoseismic area of the last seismic period and of other similar series of shocks occurred in Ilocos. It seems that the main fault where start the vibrations which propagate to this zone lies under the sea, not distant from the coast. In the map accompanying the article "The relation of seismic disturbances in the Philippines to the geologic structure"<sup>1</sup> is given its approximate position.

---

TEMBOLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

4, 6<sup>h</sup> 0<sup>m</sup> [4, 14<sup>h</sup> 0<sup>m</sup>]. Port Lebak (SW de Mindanao). Temblor de tierra de intensidad IV.

4, 11<sup>h</sup> 10<sup>m</sup> 56<sup>s\*</sup> [4, 19<sup>h</sup> 10<sup>m</sup> 56<sup>s</sup>]. Cabo Bojeador (NW de Luzón). Temblor de tierra de intensidad III-IV. Repitió a 13<sup>h</sup> 40<sup>m</sup> [21<sup>h</sup> 40<sup>m</sup>] con menos intensidad.

5, 17<sup>h</sup> 51<sup>m</sup> 40<sup>s\*</sup> [6, 1<sup>h</sup> 51<sup>m</sup> 40<sup>s</sup>]. W de Mindanao. Temblor de tierra de intensidad V-VI originado en el Mar de Célebes entre Zamboanga y Cotabato, sentido en todas las costas de las bahías Illana, Dumanquilas y Sibuguey y en Lanao.

13, 8<sup>h</sup> 55<sup>m</sup> 29<sup>s\*</sup> [13, 16<sup>h</sup> 55<sup>m</sup> 29<sup>s</sup>]. SE de Luzón, Sámar y Leyte. Extenso temblor de tierra sentido en las Provincias de Camarines, Albay, Sorsogón y Catanduanes y en las Islas de Sámar y Leyte. Su intensidad no pasó del grado IV; el epicentro parece se hallaba en el Pacífico al NE del Estrecho de San Bernardino.

13, 17<sup>h</sup> 30<sup>m</sup> [14, 1<sup>h</sup> 30<sup>m</sup>]. Ambos Camarines (SE de Luzón). Temblor de tierra de intensidad III, sentido solamente en la región del monte Isarog.

14, 20<sup>h</sup> 51<sup>m</sup> [15, 4<sup>h</sup> 51<sup>m</sup>]. Butúan (N de Mindanao). Temblor oscilatorio, dirección NE-SW, intensidad III, duración 8 segundos.

15, 14<sup>h</sup> 37<sup>m</sup> 32<sup>s\*</sup> [15, 22<sup>h</sup> 37<sup>m</sup> 32<sup>s</sup>]. W de Mindanao. Extenso temblor de tierra originado en el Mar de Célebes, aparentemente cerca del epicentro del temblor del día 5. Sacudió con intensidad IV-V las mismas porciones de los distritos de Zamboanga, Lanao y Cotabato.

20, 13<sup>h</sup> 25<sup>m</sup> 12<sup>s\*</sup> [20, 21<sup>h</sup> 25<sup>m</sup> 12<sup>s</sup>]. Aparri (NE de Luzón). Temblor oscilatorio, dirección E-W, intensidad IV, duración 7 segundos.

21, 11<sup>h</sup> 6<sup>m</sup> 35<sup>s\*</sup> [21, 19<sup>h</sup> 6<sup>m</sup> 35<sup>s</sup>]. Isla de Leyte. Temblor de tierra de intensidad III; sentido también en la parte N de la Isla de Cebú. Seguramente el epicentro se hallaba al S de la Isla de Masbate.

22, 7<sup>h</sup> 30<sup>m</sup> [22, 15<sup>h</sup> 30<sup>m</sup>]. Ormoc (W de Leyte). Temblor oscilatorio, dirección W-E, intensidad III-IV, duración 11 segundos.

22, 16<sup>h</sup> 18<sup>m</sup> 4<sup>s\*</sup> [23, 0<sup>h</sup> 18<sup>m</sup> 4<sup>s</sup>]. W de Luzón. Temblor de tierra de intensidad III, notificado solamente de Dagupan y de Cabo Bojeador. Su epicentro se hallaba en el Mar de la China, algo distante de las costas occidentales de Luzón. Debido a esto los movimientos tendrían un carácter ondulatorio lento, y así no consiguieron despertar a las gentes de las dos provincias situadas entre los puntos citados y a menor distancia del epicentro, en las cuales por fuerza hubo de ser igualmente perceptible.

24, 19<sup>h</sup> 36<sup>m</sup> [25, 3<sup>h</sup> 36<sup>m</sup>]. Zamboanga (W de Mindanao). Temblor oscilatorio, dirección NE-SW, intensidad III, duración 6 segundos. Registrado por el sismógrafo de Butúan.

30, 21<sup>h</sup> 23<sup>m</sup> 41<sup>s\*</sup> [Julio 1, 5<sup>h</sup> 23<sup>m</sup> 41<sup>s</sup>]. Islas de Panay y Negros. Temblor de tierra de intensidad III, sentido en la Provincia de Iloílo y en la de Negros Occidental. El epicentro se hallaba en el estrecho que las separa, al S de la Isla de Guimarás.

De la Isla de Tablas, cuyo período sísmico comenzó en abril, se sabe que ocurrieron pequeños temblores, el 17 y 19 hacia las 15<sup>h</sup>, el 28 a las 21<sup>h</sup> y el 30 por la tarde.<sup>2</sup>

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

<sup>2</sup> Véase "Bulletin for April, 1919."

## PERÍODO SÍSMICO DE ILOCOS SUR.

Este corto período comenzó el 20 de Junio, llegó a su máximo y terminó el día 25 con una serie de choques que alarmaron mucho la población de Vigan y las situadas al sur a lo largo de la costa.

El primer temblor perteneciente a este período ocurrió a 12<sup>h</sup> 46<sup>m</sup> 44<sup>s\*</sup> [T. I.] del día 20. Fué perceptible en toda la Provincia de Ilocos Sur con intensidad III-IV; los movimientos se propagaron con mucha irregularidad en las provincias vecinas, el ser o no ser perceptible dependiendo más bien de las condiciones locales del terreno que de la distancia; así este primer choque y otros de la serie solo parece haberse percibido bien en Bontoc, situado al E del epicentro hacia el interior de la isla, y en Aparri muy distante al NE.

A 6<sup>h</sup> 50<sup>m</sup> 1<sup>\*\*</sup> del 21 sobrevino otro de mucha menor intensidad y perceptible tan sólo en Ilocos. Los sismógrafos de Manila y de Baguio habían registrado otro choque muy débil procedente del mismo epicentro a 5<sup>h</sup> 33<sup>m</sup> 37<sup>s\*</sup>.

Los días siguientes 22, 23 y 24 no ocurrió temblor alguno perceptible, pero los sismógrafos de Baguio registraron dos sacudidas instrumentales de origen algo lejano las cuales parecen corresponder al epicentro de Ilocos.

Llegó el 25 y con él una como explosión de la tensión acumulada tal vez durante muchos años. A 2<sup>h</sup> 35<sup>m</sup> 21<sup>\*\*</sup> un temblor de intensidad VI-VII sobresaltó a los habitantes de la capital, Vigan, y de los demás pueblos del sur de la provincia. Durante unos quince segundos estuvieron temiendo no se viniesen al suelo los muchos edificios de mamostería con tejado de teja, peculiares de la ciudad de Vigan, cediendo a las terribles sacudidas. Por fortuna solo resultaron dañados algunos tejados y con grietas los muros. El área mezosísmica comprendía la región de Vigan y los pueblos del sur en una extensión de poco menos de 50 kilómetros, a lo largo de la costa, y mucho menos en dirección al E, hacia el interior de la isla. El área total donde fué perceptible comprendía toda la isla al norte del paralelo 16.5°.

Lo que hizo este período temeroso fué la rapidez con que se fueron luego sucediendo nuevos temblores o réplicas del primero, menos intensas pero lo bastante para hacer temer no sobreviniese algún terremoto de peores consecuencias; dichas repeticiones ocurrieron a 3<sup>h</sup> 37<sup>m</sup> 19<sup>s\*</sup>, 3<sup>h</sup> 53<sup>m</sup> 27<sup>s\*</sup>, 5<sup>h</sup> 8<sup>m</sup> 32<sup>s\*</sup> y 7<sup>h</sup> 18<sup>m</sup> 38<sup>s\*</sup>. A esta serie siguió la calma más completa, de tal manera que ni los sismógrafos de Manila ni los de Baguio registraron ya en todo el resto del día 25 y del mes, choque alguno instrumental procedente del centro de Ilocos. Únicamente el temblor de las 2 de la madrugada fué registrado fuera de Filipinas, en Formosa y Batavia.

Este período sísmico confirma la afirmación hecha en 1909 de que en Ilocos Sur existe un epicentro algo superficial, que parece extenderse desde el N de Vigan hasta Candón, epicentro que podríamos llamar del corte del Abra. Nadie duda que la configuración del terreno del estrecho del río Abra y de la cordillera occidental que lo encauza en dirección al norte revelan fallas importantes y convulsiones antiguas, que naturalmente pueden tener eco todavía en nuestros tiempos. La cordillera y costa occidental desde la salida del Abra hasta unos 100 kilómetros hacia el sur parece formar un bloque tectónico en equilibrio poco estable donde con alguna frecuencia se desarrollan temblores geológicos sí, pero de la clase llamada de hundimiento, pues suelen tener siempre poca extensión. En el Boletín mensual de mayo de 1909, se hizo un estudio de los temblores de Ilocos Sur y sacóse como conclusión la existencia de un epicentro a lo largo o muy cerca de la costa de Ilocos Sur, al parecer entre los 17° y 17.5° de latitud. Precisamente ésta es el área aproximada donde los temblores del último período y de otros ocurridos en diversas ocasiones desarrollaron su mayor intensidad. Parece con todo que la falla primaria de donde parten los movimientos que se comunican a la expresada zona está debajo del mar poco distante de la costa. Puede verse indicada en el mapa sísmico que acompaña el artículo "Relación entre los temblores de Filipinas y su estructura geológica."<sup>1</sup>

## BULLETIN FOR JULY, 1919.

# METEOROLOGICAL BULLETIN FOR JULY, 1919.

By Rev. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure of this month for the Philippines does not differ much from the July's normal, although in a great majority of our stations it is higher than that of the preceding year. The highest pressures were generally observed on the 7th or 8th, and the lowest on the 30th or 31st.

The mean monthly temperatures are almost identical with the normal of this month in practically all our stations. The extreme temperatures of the month for Manila were 33.9° C., 20.8, and they were registered on the 12th and 2nd, respectively. The highest and lowest monthly temperatures for Baguio were 25.2° C., 12.9° C. on the top of Mirador, and 24.9° C., 13.5° C. in the valley.

<sup>a</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—In the Visayas and Mindanao the total rainfall for this month was generally greater than last year but smaller than the normal for July, while in the southern part of Luzon, including the provinces around Manila, it was not only greater than last year, but in the majority of the stations it was also above the normal of this month. In central and northern Luzon the monthly rainfall was below that of July, 1918, and below the normal. The total amount of rainfall for Manila this month is 188.2 mm. above that of the preceding year, and 399.3 mm. above the normal, while that of Baguio is 1,364.2 mm. below that of July, 1918, and 185.5 mm. below the normal.

## RAINFALL AT VARIOUS STATIONS OF THE WEATHER BUREAU DURING THE MONTH OF JULY, 1919.

## DEPRESSIONS AND TYPHOONS.

Only one typhoon traversed the Philippines at the beginning of this month across the Batanes Islands, although two other distant typhoons, one on the China Sea, the other on the Pacific, influenced considerably on the weather in the Archipelago, particularly in Luzon, during the last week. As these last typhoons belong partly to July, partly to August, and as they caused rains in the western part of Luzon, which were just the beginning of the largest rainy period ever recorded in Manila, we prefer to leave their tracks and the corresponding discussion of same for our monthly Bulletin of next month.

Besides the three typhoons mentioned, there were two other depressions observed in higher latitudes in the Far East. They did not influence the weather of the Philippines, but moved northward, one near the Bonins on the 12th to 15th, and the other between the Loochoos and the Bonins on the 15th to 18th.

The typhoon of the Batanes Islands and southern Formosa.—This typhoon appeared on the 27th and 28th of June as forming over the Western Carolines to the SSW of Guam and E of Yap, in about 10° latitude N and near 143° longitude E. It moved WNW until July 1, when it inclined northward taking a NW direction toward the Batanes Islands and southern Formosa.

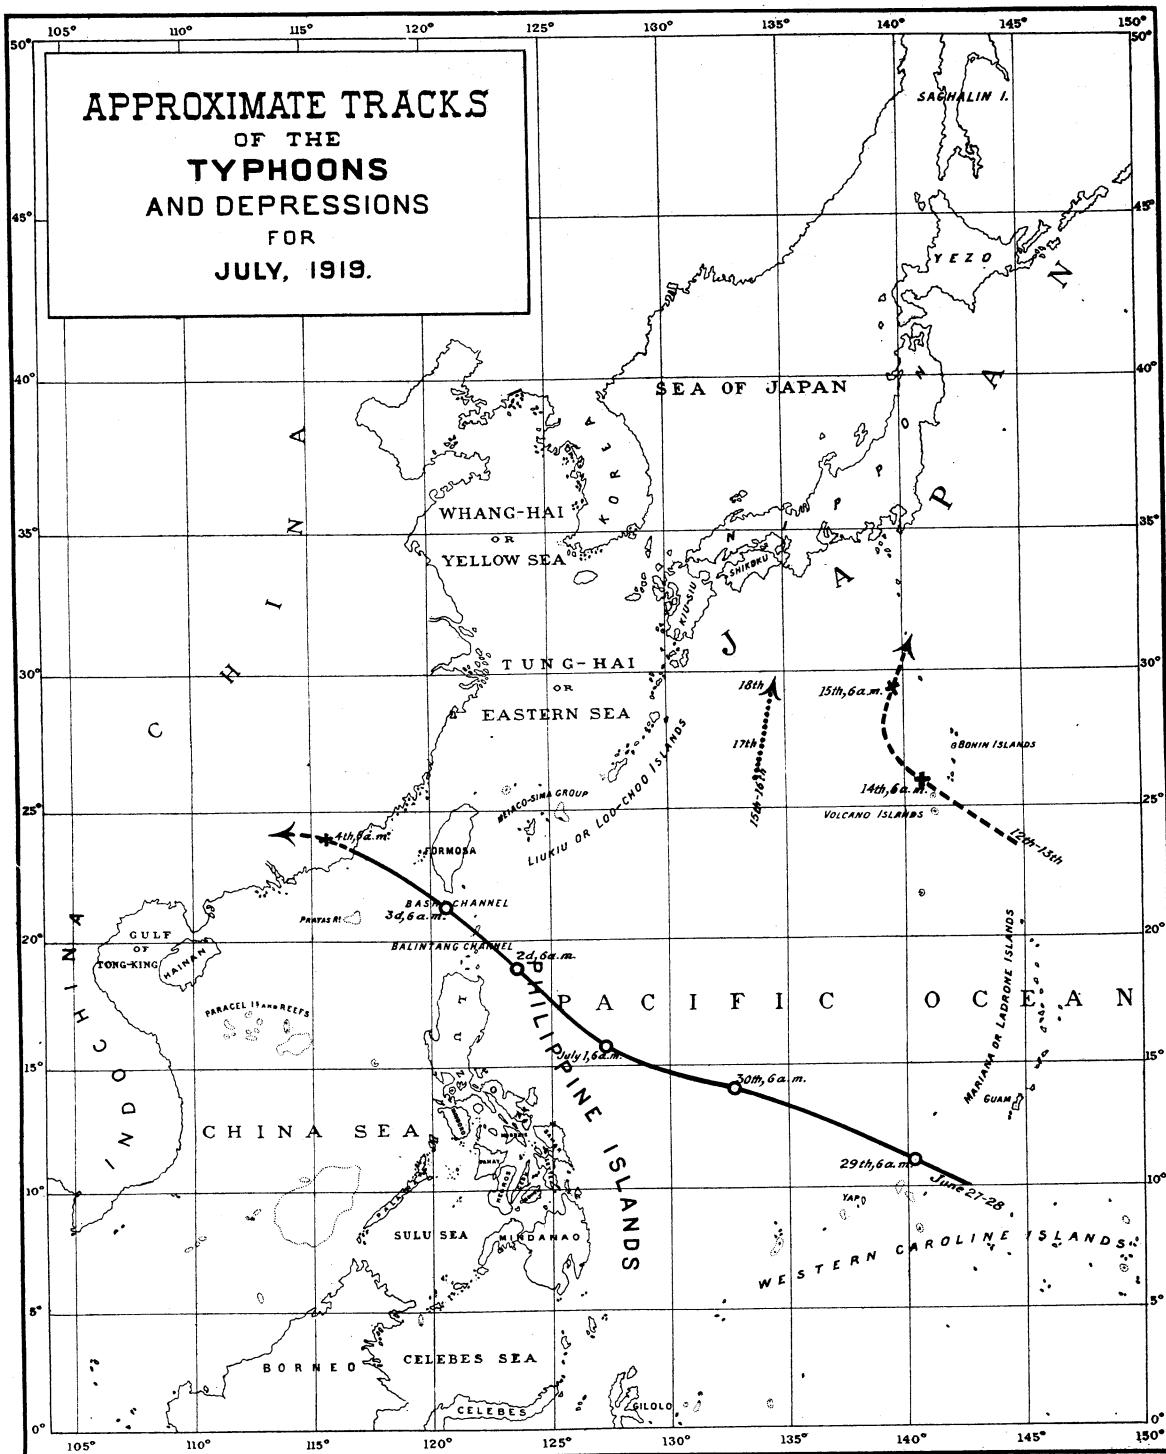

The following warnings were given out by Manila Observatory from June 28 to July 2.

June 28, 11.50 a. m.: A new typhoon seems to be forming since yesterday near or over the Western Carolines to the southwest of Guam.

June 29, 2 p. m.: The typhoon of the Western Carolines was probably situated at 2 p. m. near 139° longitude E and 12° latitude N moving WNW.

June 30, 4 p. m.: The typhoon was probably situated at 6 a. m. to-day about 500 miles to the east of San Bernardino Strait or of southern Luzon moving apparently to WNW.

*Plate IV.*

N.B.- See Plate V (Bulletin of Aug., 1919) for the other two typhoons of the last part of the month.

July 1, 11.50 a. m.: The typhoon seems to be situated this morning about 300 miles to the east of central Luzon moving probably WNW.

July 2, 10.45 a. m.: The typhoon was situated at 6 a. m. to-day between 18° and 19° latitude N, between 123° and 124° longitude E moving probably NW at present, it having inclined northward since yesterday.

The center of the typhoon passed close to the south of Santo Domingo, Batanes Islands, at 10.30 p. m. of the 2nd, the barometer having fallen there to 743.3 mm. In the early morning of the 3rd it passed close to the south of Formosa, and finally it entered China to the north of Swatow late in the evening of the same day. It is to be remarked, however, that on July 3, during practically the whole day, a secondary cyclonic center was observed over the northern part of Formosa.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes en Filipinas no difiere mucho de la normal de julio, aunque en una gran mayoría de nuestras estaciones es mayor que la del año pasado. Las presiones más altas se observaron generalmente el día 7 u 8, y las más bajas el 30 ó 31.

La temperatura media mensual es casi idéntica a la normal de este mes prácticamente en todas nuestras estaciones. Las temperaturas extremas del mes en Manila fueron 33.9° C. y 20.8° C., las cuales se registraron los días 12 y 2, respectivamente. Las temperaturas máxima y mínima del mes en Baguio fueron 25.2° C., 12.9° C. en la cumbre del Mirador, y 24.9° C., 13.5° C. en el valle.

**Precipitación acuosa.**—En Visayas y Mindanao la lluvia total de este mes fué generalmente mayor que la del año pasado, pero menor que lo normal de julio, mientras que en la parte meridional de Luzón, incluyendo las provincias cerca de Manila, no sólo fué mayor que la del año pasado sino que en la mayoría de las estaciones fué también mayor que la normal de este mes. En el centro y norte de Luzón la lluvia mensual fué menor que la de julio de 1918, y menor también que la normal. La cantidad total de lluvia en Manila durante este mes es mayor que la del año pasado en 188.2 mm., y mayor que la normal en 399.3 mm., al paso que la de Baguio es menor que la de julio de 1918 en 1,364.2 mm., y menor que la normal en 185.5 mm.

## DEPRESIONES Y TIFONES.

Un solo tifón cruzó las Filipinas a principios de este mes a través de las Islas Batanes, aunque otros dos tifones lejanos, uno en el Mar de China y otro en el Pacífico, influyeron notablemente en el tiempo del Archipiélago, sobre todo de Luzón, durante la última semana de este mes. Como estos últimos tifones pertenecen parte a julio y parte a agosto, y como produjeron lluvias en la parte occidental de Luzón, que fueron precisamente el principio del período lluvioso más notable registrado hasta el presente en Manila, preferimos dejar sus trayectorias y el correspondiente estudio de las mismas para nuestro Boletín del próximo mes.

Además de los tres tifones ya mencionados, hubo otras dos depresiones observadas en más altas latitudes en el Extremo Oriente. Dichas depresiones no influyeron en el tiempo de Filipinas, sino que se movieron al N, una cerca de Boníns los días 12 al 15, y la otra entre Loochoos y Boníns los días 15 al 18.

**El tifón de las Islas Batanes y sur de Formosa.**—Este tifón apareció los días 27 y 28 de junio como formándose en las Carolinas Occidentales al SSW de Guam y E de Yap, en los alrededores de 10° latitud N y cerca de 143° longitud E. Se movió al WNW hasta el 1.º de julio, en que se inclinó al N moviéndose al NW en dirección a las Islas Batanes y sur de Formosa.

Los siguientes avisos de tifón fueron expedidos por el Observatorio de Manila desde el 28 de junio hasta el 2 de julio:

Junio 28, 11.50 a. m.: Un nuevo tifón parece estarse formando desde ayer en, o cerca de, las Carolinas Occidentales al SW de Guam.

Junio 29, 2 p. m.: El tifón de las Carolinas Occidentales se hallaba probablemente a las 2 p. m. cerca de 139° longitud E y 12° latitud N, moviéndose al WNW.

Junio 30, 4 p. m.: El tifón se hallaba probablemente a las 6 a. m. de hoy a unas 500 millas al E del Estrecho de San Bernardino o del sur de Luzón, moviéndose aparentemente al WNW.

Julio 1, 11.50 a. m.: El tifón parece hallarse esta mañana a unas 300 millas al E del centro de Luzón, moviéndose probablemente al WNW.

Julio 1, 11.50 a. m.: El tifón parece hallarse a 6 a. m. de hoy entre 18° y 19° latitud N, entre 123° y 124° longitud E, moviéndose probablemente por ahora al NW, habiéndose inclinado al N desde ayer.

El centro del tifón pasó cerca por el sur de Santo Domingo, Islas Batanes, a las 10.30 p. m. del día 2, habiendo bajado el barómetro de dicha estación a 743.3 mm. En la madrugada del día 3 el tifón pasó cerca por el sur de Formosa, y finalmente penetró en China por el norte de Swatow la noche del mismo día. Es de notar, sin embargo, que el 3 de julio, prácticamente durante todo el día, se observó un centro ciclónico secundario en la parte septentrional de Formosa.

# SEISMOLOGICAL BULLETIN FOR JULY, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
Chief, *Seismic and Magnetic Divisions, Weather Bureau.*

## EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

2, 22<sup>h</sup> 38<sup>m</sup> 50<sup>s\*</sup> [3, 6<sup>h</sup> 38<sup>m</sup> 50<sup>s</sup>]. Butuan (N Mindanao). Oscillatory earthquake, direction ESE-WNW, intensity III, duration 8 seconds. Its epicenter lay far off in the Pacific.

3, 9<sup>h</sup> 30<sup>m</sup> [3, 17<sup>h</sup> 30<sup>m</sup>]. Candon (NW Luzon). Earthquake shock of intensity II-III.

4, 1<sup>h</sup> 38<sup>m</sup> 35<sup>s\*</sup> [4, 9<sup>h</sup> 38<sup>m</sup> 35<sup>s</sup>]. Panay and Negros. Earthquake of intensity III-IV felt through the southern part of Panay and western of Negros Islands. The origin was south of the strait which separates these islands.

4, 18<sup>h</sup> 55<sup>m</sup> 28<sup>s\*</sup> [5, 2<sup>h</sup> 55<sup>m</sup> 28<sup>s</sup>]. Maasin (S Leyte). Earthquake of intensity III.

5, 2<sup>h</sup> 45<sup>m</sup> [5, 10<sup>h</sup> 45<sup>m</sup>]. Port Lebak (SW Mindanao). Earthquake of intensity IV-V, felt in the southern portion of the Cotabato province. Aftershock at 15<sup>h</sup> 30<sup>m</sup> I. T. Both shocks were recorded by the seismograph at Butuan; the origin was in the Celebes Sea.

6, 6<sup>h</sup> 14<sup>m</sup> [6, 14<sup>h</sup> 14<sup>m</sup>]. Surigao (NE Mindanao). Oscillatory earthquake, direction W-E, intensity III, duration 3 seconds. Recorded at Butuan where an instrumental shock from the same origin, N of Butuan Bay, occurred at 15<sup>h</sup> 0<sup>m</sup> I. T.

6, 19<sup>h</sup> 11<sup>m</sup> [7, 3<sup>h</sup> 11<sup>m</sup>]. Camp Keithley (N Mindanao). Oscillatory earthquake, direction ESE-WNW, intensity III, duration 5 seconds.

7, 12<sup>h</sup> 0<sup>m</sup> [7, 20<sup>h</sup> 0<sup>m</sup>]. San Joaquin (S Panay). Earthquake of intensity IV, followed by other seven local shocks of varying intensity: the strongest occurred at 21<sup>h</sup> 30<sup>m</sup> and 23<sup>h</sup> 35<sup>m</sup> I. T. On the 6th, during the day, several light local shocks were also felt at Valladolid, Occidental Negros.

8, 12<sup>h</sup> 1<sup>m</sup> 33<sup>s\*</sup> [8, 20<sup>h</sup> 1<sup>m</sup> 33<sup>s</sup>]. Panay and Negros. Earthquake of intensity III-IV, and of the same character, extension and origin as the one occurred on the 4th. To the same epicenter south of Guimaras can be traced the shocks felt at San Joaquin and Valladolid, two coastal towns facing to the Iloilo Strait.

13, 17<sup>h</sup> 0<sup>m</sup> [14, 1<sup>h</sup> 0<sup>m</sup>]. Tablas Island. Earthquake shock of intensity III.<sup>1</sup>

15, 22<sup>h</sup> 48<sup>m</sup> [16, 6<sup>h</sup> 48<sup>m</sup>]. Guiuan (SE Samar). Oscillatory earthquake, direction E-W, intensity III-IV, duration 7 seconds.

16, 11<sup>h</sup> 37<sup>m</sup> [16, 19<sup>h</sup> 37<sup>m</sup>]. Cabo Bojeador (NW Luzon). Earthquake shock of intensity II-III.

17, 4<sup>h</sup> 48<sup>m</sup> [17, 12<sup>h</sup> 48<sup>m</sup>]. Butuan (N Mindanao). Oscillatory earthquake, direction NNW-SSE, intensity III, duration 6 seconds.

17, 7<sup>h</sup> 25<sup>m</sup> [17, 15<sup>h</sup> 25<sup>m</sup>]. Tablas Island. Earthquake shock of intensity III-IV.<sup>2</sup>

19, 20<sup>h</sup> 0<sup>m</sup> [20, 4<sup>h</sup> 0<sup>m</sup>]. Camp Keithley (N Mindanao). Earthquake shocks of intensity III, direction ESE-WNW, duration 4 seconds.

24, 19<sup>h</sup> 38<sup>m</sup> [25, 3<sup>h</sup> 38<sup>m</sup>]. Ambos Camarines (SE Luzon). Earthquake shocks of intensity III-IV, felt in the region around Mount Isarog.

25, 23<sup>h</sup> 19<sup>m</sup> [26, 7<sup>h</sup> 19<sup>m</sup>]. Camp Keithley (N Mindanao). Earthquake of intensity IV, short duration.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), insular time being added in brackets for the convenience of the Philippine readers.

<sup>2</sup> See "Bulletin for April, 1919."

## RECORDS OF THE MICROSEISMOGRAPH.

(Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.25, \epsilon=2.906, \frac{r}{T_0^2}=0.053;$   
 $A_E: T_0=6.18, \epsilon=2.393, \frac{r}{T_0^2}=0.042.$  Alluvium. 2.40 meters above sea level.)

TEMBLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

2, 22<sup>h</sup> 38<sup>m</sup> 50<sup>s\*</sup> [3, 6<sup>h</sup> 38<sup>m</sup> 50<sup>s</sup>]. **Butúan** (N de Mindanao). Temblor oscilatorio, dirección ESE-WNW, intensidad III, duración 8 segundos. Su origen se hallaba algo lejos en el Mar Pacífico.

3, 9<sup>h</sup> 30<sup>m</sup> [3, 17<sup>h</sup> 30<sup>m</sup>]. **Candón** (NW de Luzón). Temblor de tierra de intensidad II-III.

4, 1<sup>h</sup> 38<sup>m</sup> 35<sup>s\*</sup> [4, 9<sup>h</sup> 38<sup>m</sup> 35<sup>s</sup>]. **Panay y Negros.** Temblor de tierra de intensidad III-IV, sentido en la parte sur de la Isla de Panay y oeste de la de Negros. El epicentro parece se hallaba en la parte sur del estrecho que separa dichas islas.

4, 18<sup>h</sup> 55<sup>m</sup> 28<sup>s\*</sup> [5, 2<sup>h</sup> 55<sup>m</sup> 28<sup>s</sup>]. **Maasin** (S de Leyte). Temblor de tierra de intensidad III.

5, 2<sup>h</sup> 45<sup>m</sup> [5, 10<sup>h</sup> 45<sup>m</sup>]. **Port Lebak** (SW de Mindanao). Temblor de tierra de intensidad IV-V sentido en toda la parte sur del distrito de Cotabato. Repetición a 15<sup>h</sup> 30<sup>m</sup> T. I. Ambos fueron registrados por el sismógrafo de Butúan; el epicentro estaba en el Mar de Célebes.

6, 6<sup>h</sup> 14<sup>m</sup> [6, 14<sup>h</sup> 14<sup>m</sup>]. **Surigao** (NE de Mindanao). Temblor oscilatorio, dirección W-E, intensidad III, duración 3 segundos. Registrado en Butúan, donde a 15<sup>h</sup> 0<sup>m</sup> se registró otro choque instrumental originado en el mismo epicentro en la parte N de la bahía de Butúan.

6, 19<sup>h</sup> 11<sup>m</sup> [7, 3<sup>h</sup> 11<sup>m</sup>]. **Camp Keithley** (N de Mindanao). Temblor oscilatorio, dirección ESE-WNW, intensidad III, duración 5 segundos.

7, 12<sup>h</sup> 0<sup>m</sup> [7, 20<sup>h</sup> 0<sup>m</sup>]. **San Joaquín** (S de Panay). Temblor de tierra de intensidad IV; seguido de una serie de siete temblores locales de varia intensidad; los más fuertes ocurrieron a 21<sup>h</sup> 30<sup>m</sup> y a 23<sup>h</sup> 35<sup>m</sup> T. I. Durante el día 6 se sintieron también en Valladolid (W de Negros) varios temblorcitos locales.

8, 12<sup>h</sup> 1<sup>m</sup> 33<sup>s\*</sup> [8, 20<sup>h</sup> 1<sup>m</sup> 33<sup>s</sup>]. **Panay y Negros.** Temblor de tierra de intensidad III-IV, de igual carácter, extensión y origen que el del día 4. Del mismo epicentro, al sur de la Isla Guimarás, se propagaron sin duda los temblores sentidos en San Joaquín y Valladolid, dos poblaciones playeras que miran al estrecho de Iloílo.

13, 17<sup>h</sup> 0<sup>m</sup> [14, 1<sup>h</sup> 0<sup>m</sup>]. **Isla de Tablas.** Temblor de tierra de intensidad III.<sup>2</sup>

15, 22<sup>h</sup> 48<sup>m</sup> [16, 6<sup>h</sup> 48<sup>m</sup>]. **Guiuan** (SE de Sámar). Temblor oscilatorio, dirección E-W, intensidad III-IV, duración 7 segundos.

16, 11<sup>h</sup> 37<sup>m</sup> [16, 19<sup>h</sup> 37<sup>m</sup>]. **Cabo Bojeador** (NW de Luzón). Temblor de tierra de intensidad II-III.

17, 4<sup>h</sup> 48<sup>m</sup> [17, 12<sup>h</sup> 48<sup>m</sup>]. **Butúan** (N de Mindanao). Temblor oscilatorio, dirección NNW-SSE, intensidad III, duración 6 segundos.

17, 7<sup>h</sup> 25<sup>m</sup> [17, 15<sup>h</sup> 25<sup>m</sup>]. **Isla de Tablas.** Temblor de tierra de intensidad III-IV.<sup>1</sup>

19, 20<sup>h</sup> 0<sup>m</sup> [20, 4<sup>h</sup> 0<sup>m</sup>]. **Camp Keithley** (N de Mindanao). Temblor oscilatorio, dirección ESE-WNW, intensidad III, duración 4 segundos.

24, 19<sup>h</sup> 38<sup>m</sup> [25, 3<sup>h</sup> 38<sup>m</sup>]. **Ambos Camarines** (SE de Luzón). Temblor de tierra de intensidad III-IV, sentido en la región del Monte Isarog.

25, 23<sup>h</sup> 19<sup>m</sup> [26, 7<sup>h</sup> 19<sup>m</sup>]. **Camp Keithley** (N de Mindanao). Temblor de tierra de intensidad IV, duración corta.

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche = 0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

## **BULLETIN FOR AUGUST, 1919.**

## METEOROLOGICAL BULLETIN FOR AUGUST, 1919.

By Rev. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

### GENERAL WEATHER NOTES.

**Pressure and temperature.**—Owing to the frequency of typhoons which influenced the weather of the Philippines during this month, it is not surprising that the monthly mean atmospheric pressure is quite below that of the preceding year and below the August's normal, especially in Luzon. That of Aparri differs from the normal by -2.58 mm., and from the monthly mean of August, 1918, by -3.72 mm. The lowest pressures of the month were generally observed on the 7th and 8th or on the 20th.

The mean monthly temperature is slightly below the normal in Luzon while it is above the same in the Visayas and Mindanao. The abundant rains experienced in Luzon during this month may account for this apparent anomaly. The highest and lowest monthly temperatures for Manila were 31.8° C. and 22.5° C.: they were registered on the 22nd and 25th, respectively. The extreme temperatures for Baguio were 21.9° C., 14.3° C. on the top of Mirador, and 22.8° C., 14.9° C. in the valley.

<sup>a</sup> 29 days of observation.

<sup>b</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—The distribution of rainfall is very remarkable. While the rains were very abundant and considerably above the normal in Luzon and most particularly so in the western part of the Island, they were below the normal in the Visayas with the only two exceptions of Romblon and Iloilo. The total monthly rainfall for Manila is 1,983.0 mm. This breaks all our records since the foundation of the Observatory in 1865. The

highest monthly rainfall for August had been that recorded in 1877 with a total amount of 1,095.6 mm. Even including all the other months of the year, the absolute highest amount ever recorded was that of September 1867 with a monthly total of 1,469.7 mm. Our readers are referred to a special pamphlet which will be published as a separate publication on the rains, floods and typhoons of this month and on the annual rainfall for the whole year 1919. As to the floods of Manila and neighbouring provinces, we will only say here that they were very remarkable not so much for their height as for their extremely protracted duration.

## DEPRESSIONS AND TYPHOONS.

There were no less than eight typhoons influencing the weather in the Philippines during about five weeks beginning the last week of July until the first day of September. The tracks of all these typhoons are reproduced in Plates V and VI, and a brief description of same shall be given here, it being our intention, as stated above, to study them more in detail in a separate pamphlet.

**Two simultaneous typhoons: July 22 to August 6, 1919.**—On July 22 to 23 a depression or typhoon seemed to be forming over the Pacific to the SW of Guam near 11° latitude N and 142° or 143° longitude E. Its center appeared on our weather map for 6 a. m. of July 26 to the east of central Luzon not far from 130° longitude E and 15° latitude N moving at that time WNW. The typhoon moved northward on the 27th, northeastward on the 28th, and recurved northwestward on the 30th passing near Naha on the evening of that day. When the typhoon reached 30° latitude, it inclined again northward on August 1st, to the east of Shanghai, and recurved northeastward, thus crossing the southern part of Korea during the night of August 3 to 4.

Simultaneously with the preceding typhoon, another one formed over the China Sea on July 24 to 25, near 16° latitude N and 117° longitude E. It moved WNW until July 29, when it recurved northeastward near the southern coast of Hainan. The ty-

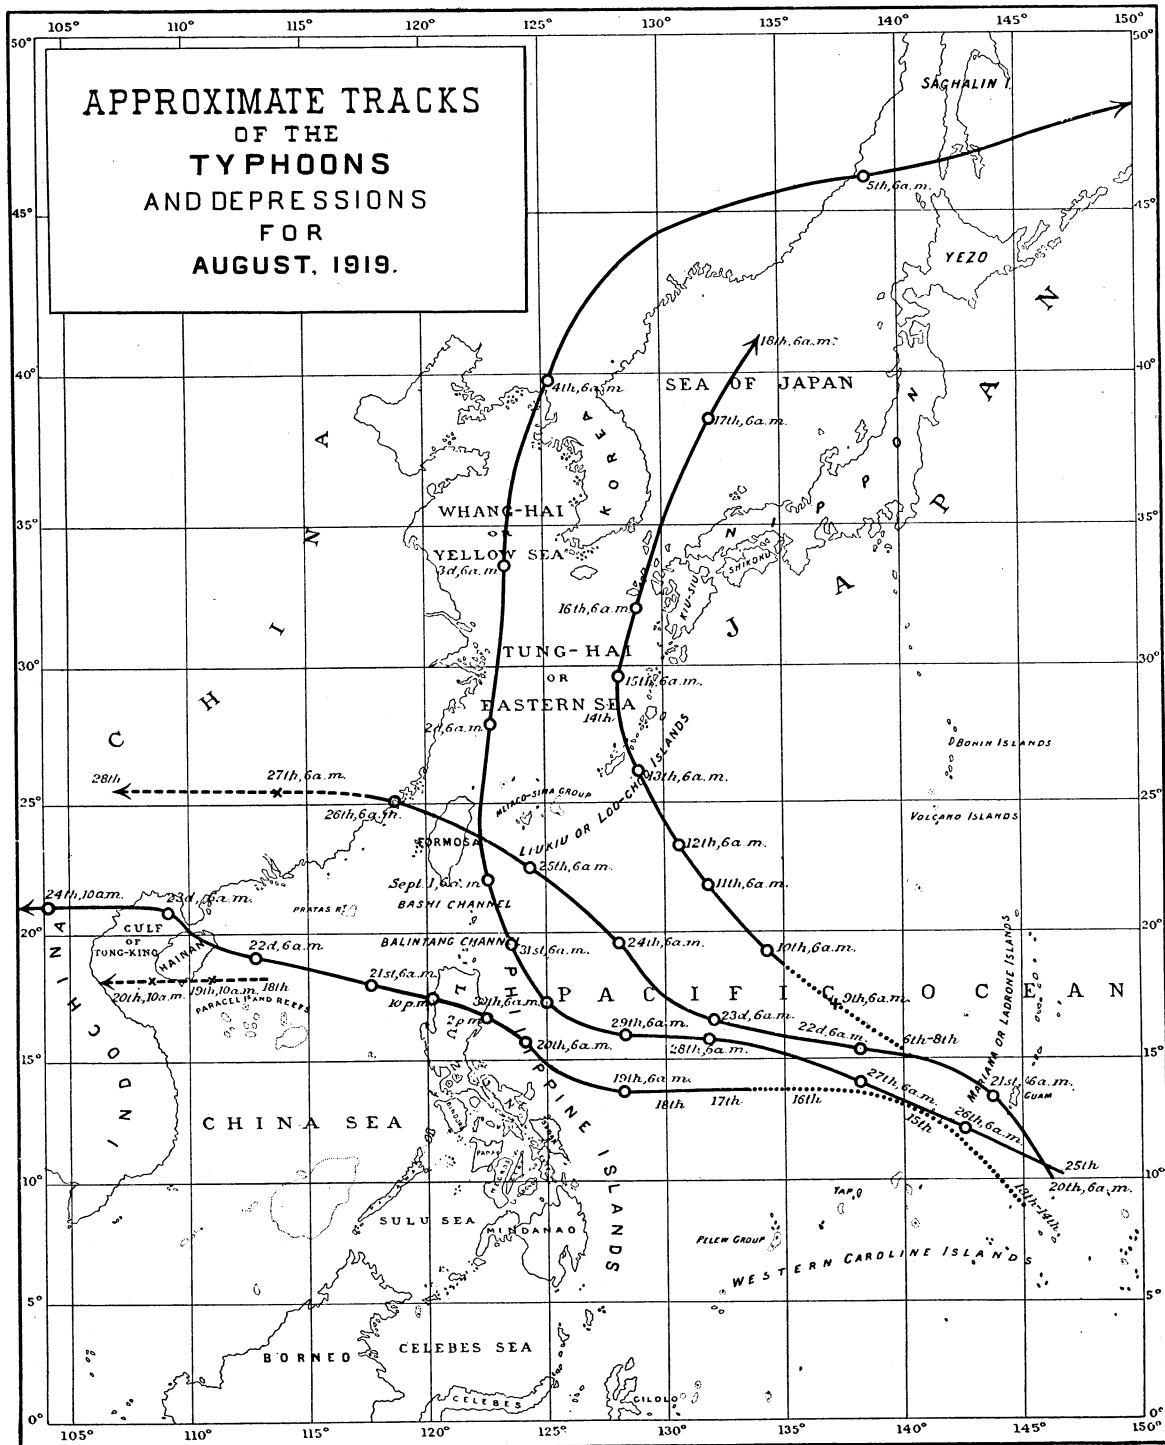

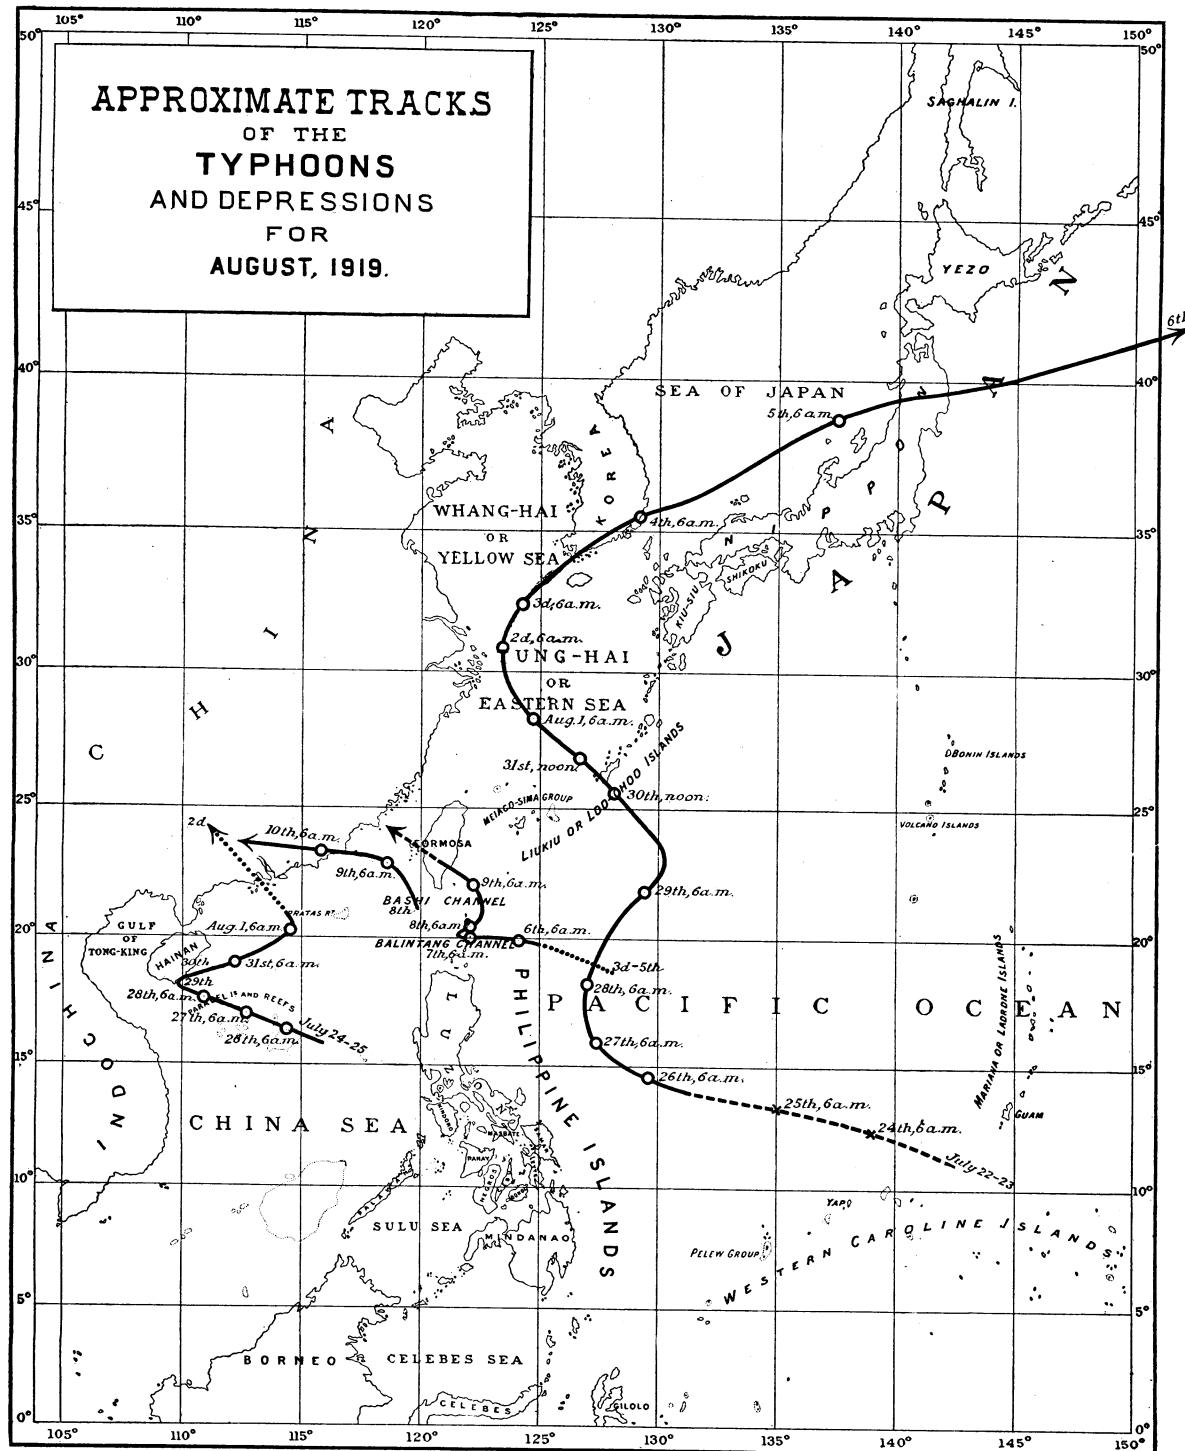

PLATE V

phoon was south of Hongkong in the early morning of August 1, when it seems to have recurred back northwestward.

Two typhoons over or near southern Formosa: August 3 to 10, 1919.—That there were two simultaneous typhoons since the afternoon of August 8, one to the southeast of Formosa and the other to the west of southern Formosa, over the southern part of Formosa Channel, there can be no doubt. Yet, it is hard to point out with certainty the origin of the two typhoons. The observations made at Basco, Batanes Islands, however, as compared with those of Luzon and Formosa, seems to show (1) that one typhoon appeared on August 3 to 5 over the Pacific and crossed the Balintang Channel on the 6th to 7th, recurving northeastward near and to the south of the Batanes Islands (See Plate V); then in the afternoon of the 8th it moved back northwest toward southern Formosa, crossing that part of the Island in the afternoon of the 9th; (2) that the other typhoon formed near and to the west of Bashi Channel in the morning of the 8th, and after moving northward for a short time, it crossed westward the southern part of Formosa Channel on the 9th and entered China to the south and very close to Swatow during the night of August 9 to 10.

A typhoon in the Loochoos and the Korea Strait: August 6 to 18, 1919.—This was a well developed typhoon and of great extension, influencing at the same time on the weather of Japan, Formosa and the Philippines. It formed on the 6th to 8th west of the Ladrone Islands in about  $140^{\circ}$  longitude E and  $15^{\circ}$  latitude N, and moved NW and NNW until the 13th when, reaching the Loochoos, it inclined northward and finally recurved to NNE on the 15th.

A typhoon over northern Luzon: August 13 to 24, 1919.—This typhoon was probably formed on the 13th to 14th to the south of Guam near  $145^{\circ}$  longitude E and  $9^{\circ}$  latitude N. Owing to lack of sufficient observations, the first part of the track of this typhoon up to the 16th can only be given with a certain degree of probability. On the 17th to 19th the typhoon could be situated east of southern Luzon but moving very slowly westward; on the 19th, however, it inclined northwest while increasing considerably its rate of progress; on the 20th it inclined again westward and crossed the nothern part of Luzon moving W by N through the provinces of Isabela, Mountain and Ilocos Sur. The center of the typhoon reached Hainan in the afternoon of the 22nd.

While the preceding typhoon was near or over Luzon on the 18th to 20th, a depression of little importance seems to have appeared over the China Sea near the Paracels and moved westward close to the southern coast of Hainan.

Another typhoon over Formosa: August 20 to 28, 1919.—Simultaneously with the Luzon typhoon of August 20, another one appeared on that day to the SSE of Guam in about  $10^{\circ}$  latitude N and  $146^{\circ}$  longitude E. It moved first northwestward passing to the southwest and west of Guam in the early morning of the 21th, when the barometer registered its lowest reading 743 mm.; but in the afternoon of the same day it inclined decidedly westward threatening the northern part of Luzon. Fortunately, however, for Luzon, but unfortunately for Formosa, the typhoon inclined again northwestward in the afternoon of the 23rd, and reached Formosa in the afternoon of the 25th moving WNW. The center entered China north of Amoy in the morning of the 26th.

Typhoon near the Batanes and Formosa: August 25 to September 5, 1919.—The preceding typhoon did not yet reached Formosa, when another one made its appearance on August 25 in about the same place where the former had appeared, viz. near  $10^{\circ}$  latitude N and  $146^{\circ}$  longitude E. It moved first WNW and then W until the afternoon of the 29th when it began to incline northward. On the 30th it was moving NNW, thus disappearing any danger for Luzon. On the 31st it passed to the east and not far from the Batanes Islands; on September 1st it moved northward near the eastern coast of Formosa; on the 2nd it passed east of Shanghai moving still northward, and on the 4th it entered northern Korea recurving northeastward.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—Debido a la frecuencia de tifones que influyeron en el tiempo de Filipinas durante este mes, no es de extrañar que la presión atmosférica media mensual sea bastante menor que la del año pasado y menor también que la normal de agosto, especialmente en Luzón. La de Aparri difiere de la normal en  $-2.58$  mm., y de la media mensual de agosto de 1918, en  $-3.72$  mm. Las presiones más bajas del mes se observaron generalmente los días 7 y 8 o el 20.

La temperatura media mensual es ligeramente menor que la normal en Luzón, al paso que es mayor que la misma en Visayas y Mindanao. Las abundantes lluvias caídas en Luzón durante este mes pueden justificar esta aparente anomalía. Las temperaturas máxima y mínima del mes en Manila fueron  $31.8^{\circ}$  C. y  $22.5^{\circ}$  C., las cuales tuvieron lugar los días 22 y 25, respectivamente. Las temperaturas extremas de Baguio fueron  $21.9^{\circ}$  C.,  $14.3^{\circ}$  C. en la cumbre del Mirador, y  $22.8^{\circ}$  C.,  $14.9^{\circ}$  C. en el valle.

**Precipitación acuosa.**—La distribución de la lluvia de este mes es muy extraordinaria. Mientras que las lluvias fueron muy copiosas y considerablemente mayores que la normal en Luzón y más particularmente en la parte occidental de la isla, fueron menores que la normal en Visayas y Mindanao, con las dos únicas excepciones de Romblón e Iloílo. La cantidad total de lluvia caída en Manila durante el mes es 1,983.0 mm., la cual supera todos nuestros registros desde la fundación del Observatorio en 1865. La máxima lluvia mensual de agosto había sido la observada en 1877 con una cantidad total de 1,095.6 mm. Aún incluyendo todos los demás meses del año, la mayor cantidad de lluvia mensual registrada hasta aquí había sido la de septiembre de 1876 con un total de 1,469.7 mm. Remitimos a nuestros lectores a un folleto especial que pensamos publicar aparte referente a las lluvias, inundaciones y tifones de este mes y a la lluvia anual de todo el año 1919. Cuanto a las inundaciones de Manila y provincias vecinas, nos limitamos a decir aquí que fueron sumamente notables no tanto por la altura a que llegó el agua cuanto por su duración extremadamente prolongada.

## DEPRESIONES Y TIFONES.

Hubo no menos de ocho tifones que influyeron en el tiempo de Filipinas durante unas cinco semanas a contar desde la última de julio hasta el día 1.<sup>o</sup> de septiembre. Nos contentaremos por ahora con reproducir las trayectorias de estos tifones en las Láminas V y VI y dar una breve descripción de las mismas, confiando poder dar más detalles en un folleto aparte que, como queda indicado, pensamos publicar más tarde.

**Dos tifones simultáneos: 22 de julio a 6 de agosto, 1919.**—Del 22 al 23 de julio parece haberse formado una depresión o tifón en el Pacífico al SW de Guam cerca de  $11^{\circ}$  latitud N y  $142^{\circ}$  o  $143^{\circ}$  longitud E. Su centro se echa de ver en nuestro mapa del tiempo de 6 a. m. del 26 de julio al E del centro de Luzón no lejos de  $130^{\circ}$  longitud E y  $15^{\circ}$  latitud N, moviéndose entonces al WNW. El tifón se movió al N el día 27, y al NE el 28, y recurvió al NW el 30, pasando por Naha la noche de aquel día. Cuando el tifón llegó a  $30^{\circ}$  latitud, se inclinó de nuevo al N, el día 1.<sup>o</sup> de agosto, por el E de Shanghai, y recurvió después al NE, cruzando así la parte meridional de Korea durante la noche del 3 al 4 de agosto.

Simultáneamente con el tifón anterior, se formó otro en el Mar de China del 24 al 25 de julio, cerca de  $16^{\circ}$  latitud N y  $117^{\circ}$  longitud E. Se movió al WNW hasta el 29 de julio en que recurvió al NE cerca de la costa meridional de Hainán. El tifón se hallaba al S de Hongkong la madrugada del 1.<sup>o</sup> de agosto, cuando de nuevo cambió de dirección moviéndose al NW.

**Dos tifones en el, o cerca del sur de Formosa: 3 al 10 de agosto, 1919.**—Que hubo dos tifones simultáneos desde la tarde del 8 de agosto, uno al SE de Formosa y otro al W

del sur de la misma isla, en la parte meridional del Canal de Formosa, está fuera de toda duda. Con todo, es difícil indicar con certeza el origen de los dos tifones. Sin embargo, las observaciones hechas en Basco, Islas Batanes, comparadas con las de Luzón y Formosa, parecen demostrar (1) que un tifón apareció del 3 al 5 de agosto en el Pacífico y atravesó el Canal de Balintang del 6 al 7, recurvando al NE cerca y por el S de las Islas Batanes (véase Lámina V); luego la tarde del 8 se movió de nuevo al NW en dirección al S de Formosa, cruzando aquella parte de dicha isla la tarde del día 9; (2) que el otro tifón se formó cerca y al W del Canal de Bashi la mañana del día 8, y después de moverse al N por breve tiempo, cruzó en dirección al W la parte meridional del Canal de Formosa el día 9, y penetró en China por el S y muy cerca de Swatow durante la noche del 9 al 10 de agosto.

Un tifón en Loochoos y en el Estrecho de Korea: agosto 6 al 18, 1919.—Este fué un tifón bien desarrollado y de grande extensión que llegó a influir simultáneamente en el tiempo de Japón, Formosa y Filipinas. Se formó del 6 al 8 al W de las Islas Ladrones en los alrededores de 140° longitud E y 15° latitud N, y se movió al NW y NNW hasta el día 13 en que, llegando a Loochoos, se inclinó al N, y finalmente recurvó al NNE el día 15.

Un tifón en el N de Luzón: agosto 13 al 24, 1919.—Este tifón se formó probablemente del 13 al 14 de agosto al S de Guam cerca de 145° longitud E y 9° latitud N. Debido a la falta de suficientes observaciones, la primera parte de la trayectoria de este tifón hasta el día 16 sólo puede darse como probable. Del 17 al 19 el tifón se hallaba al E del sur de Luzón, pero moviéndose muy lentamente al W; el 19, sin embargo, se inclinó al NW mientras aceleraba considerablemente su movimiento de traslación; el día 20 se inclinó de nuevo al W y cruzó la parte septentrional de Luzón en dirección al W $\frac{1}{4}$ NW a través de las Provincias de Isabela, Montañosa e Ilocos Sur. El centro del tifón llegó a Hainán la tarde del 22.

Mientras el tifón anterior estaba en o cerca de Luzón del 18 al 20, una depresión de poca importancia parece haber aparecido en el Mar de China cerca de Paracels, la cual se movió al W no lejos de la costa meridional de Hainán.

Otro tifón en Formosa: agosto 20 al 28, 1919.—Simultáneamente con el tifón de Luzón de 20 de agosto, apareció otro en dicho día al SSE de Guam en los alrededores de 10° latitud N y 146° longitud E. Se movió primero al NW, pasando por el SW y W de Guam la madrugada del día 21, en que el barómetro registró su mínima lectura que fué 743 mm.; pero la tarde del mismo día se inclinó decididamente al W, amenazando la parte septentrional de Luzón. Afortunadamente, sin embargo, para Luzón, pero desgraciadamente para Formosa, el tifón volvió a inclinarse al NW la tarde del 23, y llegó a Formosa la tarde del 25, moviéndose al WNW. El centro del tifón penetró en China por el N de Amoy la mañana del 26.

Tifón cerca de Batanes y Formosa: 25 de agosto al 5 de septiembre, 1919.—No había llegado aún a Formosa el tifón anterior, cuando apareció otro el 25 de agosto cerca de 10° latitud N y 146° longitud E. Empezó a moverse al WNW, y luego se dirigió al W hasta la tarde del 29 en que comenzó a inclinarse al N. El día 30 se movió al NNW, desapareciendo así todo peligro para Luzón. El día 31 pasó por el E y no lejos de las Islas Batanes; el 1.º de septiembre se movió al N cerca de la costa oriental de Formosa; el 2 pasó por el E de Shanghai, moviéndose aún al N, y el 4 penetró en el N de Korea recurvando al NE.

METEOROLOGICAL DATA FOR MANILA CENTRAL OBSERVATORY.<sup>a</sup>[ $\phi = 14^\circ 34' 41'' \text{ N}$ ;  $\lambda = 120^\circ 58' 33'' \text{ E}$ ; barometer above sea, 14.2 meters; gravity correction not applied, -1.72 mm.]

## SEISMOLOGICAL BULLETIN FOR AUGUST, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,

Chief, Seismic and Magnetic Divisions, Weather Bureau.

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

2, 6<sup>h</sup> 56<sup>m</sup> [2, 14<sup>h</sup> 56<sup>m</sup>]. Butuan (N Mindanao). Earthquake shock of intensity II-III; very near origin.

4, 9<sup>h</sup> 31<sup>m</sup> [4, 17<sup>h</sup> 31<sup>m</sup>]. Tigaon (SE Luzon). Earthquake of intensity III, with subterranean rumbling. It repeated at 9<sup>h</sup> 50<sup>m</sup> [17<sup>h</sup> 50<sup>m</sup>]. Origin in the Isarog mountain.

5, 2<sup>h</sup> 0<sup>m</sup> [5, 10<sup>h</sup> 0<sup>m</sup>]. Cabo Bojeador (NW Luzon). Oscillatory earthquake, intensity III; short duration.

6, 5<sup>h</sup> 37<sup>m</sup> 36<sup>s</sup>\* [6, 13<sup>h</sup> 37<sup>m</sup> 36<sup>s</sup>]. S Mindanao. Earthquake of intensity V-VI, originated in the Celebes Sea and felt through the Cotabato and Davao Provinces. It was recorded and lightly felt at Butuan.

6, 18<sup>h</sup> 0<sup>m</sup> 0<sup>s</sup>\* [7, 2<sup>h</sup> 0<sup>m</sup> 0<sup>s</sup>]. Davao (SE Mindanao). Earthquake of intensity IV-V; originated apparently towards the southern part of the Davao Gulf. It was also weakly felt at Butuan.

11, 8<sup>h</sup> 4<sup>m</sup> [11, 16<sup>h</sup> 4<sup>m</sup>]. Central Mindanao. Earthquake of intensity V-VI, felt only in the Province of Lanao. It probably originated in the volcanic region of Makaturing and Ragang volcanoes, S of Lake Lanao. Recorded at Butuan.

13, 4<sup>h</sup> 2<sup>m</sup> [13, 12<sup>h</sup> 2<sup>m</sup>]. Davao (SE Mindanao). Earthquake shock of intensity III; it repeated few minutes later. The region shaken comprised a small portion of the south Agusan Valley belonging politically to the Davao Province.

14, 7<sup>h</sup> 59<sup>m</sup> 55<sup>s</sup>\* [14, 15<sup>h</sup> 59<sup>m</sup> 55<sup>s</sup>]. Tablas Island. Earthquake of intensity VI-VII; the epicentral region comprised the southwestern portion of the island. It was also felt in the Island of Romblon, eastern Mindoro and NW Panay. The earthquake was preceded by four premonitory shocks of intensity IV-V at 6<sup>h</sup> 0<sup>m</sup>, 6<sup>h</sup> 8<sup>m</sup>, 6<sup>h</sup> 28<sup>m</sup>, and 13<sup>h</sup> 11<sup>m</sup> L.T. Two light aftershocks occurred at 23<sup>h</sup> 0<sup>m</sup> and 23<sup>h</sup> 58<sup>m</sup>. These earthquakes form a continuation of the seismic period which began with the destructive earthquake of April 28th.<sup>2</sup>

14, 20<sup>h</sup> 22<sup>m</sup> [15, 4<sup>h</sup> 22<sup>m</sup>]. Surigao (NE Mindanao). Earthquake shock of intensity III. Recorded at Butan; origin in the Butuan Bay.

18, 4<sup>h</sup> 15<sup>m</sup> [18, 12<sup>h</sup> 15<sup>m</sup>]. Borongan (E Samar). Oscillatory earthquake, intensity III, duration 4 seconds.

19, 14<sup>h</sup> 21<sup>m</sup> 48<sup>s</sup>\* [19, 22<sup>h</sup> 21<sup>m</sup> 48<sup>s</sup>]. N Luzon. Extensive earthquake felt with intensity V-VI in the northernmost provinces of Luzon. Its origin lay near the northern end of the central mountain range of Luzon. It was felt through the main portion of the island north of parallel 16° N. Recorded at Taihoku, Formosa.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

<sup>2</sup> See "Bulletin for April, 1919."

21, 4<sup>h</sup> 4<sup>m</sup> [21, 12<sup>h</sup> 4<sup>m</sup>]. Ormoc (W Leyte). Oscillatory earthquake, direction SW-NE, intensity IV, duration 10 seconds. After few seconds occurred light shocks apparently subsultory.

22, 5<sup>h</sup> 25<sup>m</sup> [22, 13<sup>h</sup> 25<sup>m</sup>]. Davao (SE Mindanao). Earthquake of intensity III, felt in the eastern part of Davao Gulf.

23, 11<sup>h</sup> 50<sup>m</sup> [23, 19<sup>h</sup> 50<sup>m</sup>]. Isabela (W Negros). Earthquake of intensity III, felt in an extensive portion of Occidental Negros.

29, 5<sup>h</sup> 49<sup>m</sup> [29, 15<sup>h</sup> 28<sup>m</sup>]. Guam (Mariana Islands). Earthquake of intensity III, originated in the Pacific, towards the Palaos Islands. Recorded at Manila at 5<sup>h</sup> 48<sup>m</sup>, in the Far East and in America.

#### RECORDS OF THE MICROSEISMOGRAPH.

(Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.25, \epsilon=2.906, \frac{r}{T_0^2}=0.053;$   
 $A_E: T_0=6.18, \epsilon=2.393, \frac{r}{T_0^2}=0.042.$  Alluvium. 2.40 meters above sea level).

TEMBLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

2, 6<sup>h</sup> 56<sup>m</sup> [2, 14<sup>h</sup> 56<sup>m</sup>]. Butúan (N de Mindanao). Temblor de tierra de intensidad II-III, de origen muy cercano.

4, 9<sup>h</sup> 31<sup>m</sup> [4, 17<sup>h</sup> 31<sup>m</sup>]. Tigaon (SE de Luzón). Temblor de tierra de intensidad III, acompañado de ruido subterráneo. Repitió a 9<sup>h</sup> 50<sup>m</sup> [17<sup>h</sup> 50<sup>m</sup>]. Origen en el monte Isarog.

5, 2<sup>h</sup> 0<sup>m</sup> [5, 10<sup>h</sup> 0<sup>m</sup>]. Cabo Bojeador (NW de Luzón). Temblor oscilatorio de intensidad III, duración corta.

6, 5<sup>h</sup> 37<sup>m</sup> 36<sup>s</sup>\* [6, 13<sup>h</sup> 37<sup>m</sup> 36<sup>s</sup>]. Sur de Mindanao. Temblor de tierra de intensidad V-VI originado en el Mar de Célebes y sentido en las provincias de Cotabato y Dávao. Registrado y sentido también muy débilmente en Butúan.

6, 18<sup>h</sup> 0<sup>m</sup> 0<sup>s</sup>\* [7, 2<sup>h</sup> 0<sup>m</sup> 0<sup>s</sup>]. Dávao (SE de Mindanao). Temblor de tierra de intensidad IV-V originado al parecer hacia la parte sur del Golfo de Dávao. Sentido también muy débilmente en Butúan.

11, 8<sup>h</sup> 4<sup>m</sup> [11, 16<sup>h</sup> 4<sup>m</sup>]. Centro de Mindanao. Temblor de tierra de intensidad V-VI, sentido solamente en el distrito de Lánao. Su origen probablemente se hallaba en la región volcánica del Makaturing y del Ragang, situados al sur de la laguna de Lánao: registróse en Butúan.

13, 4<sup>h</sup> 2<sup>m</sup> [13, 12<sup>h</sup> 2<sup>m</sup>]. Dávao (SE de Mindanao). Temblor de tierra de intensidad III. Repitió pocos minutos después. La región afectada comprendía una pequeña porción de la parte más meridional del Valle del Agusan, perteneciente políticamente a la Provincia de Dávao.

14, 7<sup>h</sup> 59<sup>m</sup> 55<sup>s</sup>\* [14, 15<sup>h</sup> 59<sup>m</sup> 55<sup>s</sup>]. Isla de Tablas. Temblor de tierra de intensidad VI-VII; el origen y región epicentral comprendía la parte SW de la Isla de Tablas; sintióse también en las islas vecinas de Romblón, E de Mindoro y NW de Panay. Precedieron a manera de choques premonitores cuatro temblores de intensidad IV-V, a 6<sup>h</sup> 0<sup>m</sup>, 6<sup>h</sup> 8<sup>m</sup>, 6<sup>h</sup> 28<sup>m</sup> y 13<sup>h</sup> 11<sup>m</sup> de Tiempo Insular. Solamente ocurrieron dos repeticiones de poca intensidad a 23<sup>h</sup> y 23<sup>h</sup> 58<sup>m</sup>. Estos temblores son continuación del período sísmico que principió con el terremoto destructor del 28 de abril.<sup>2</sup>

14, 20<sup>h</sup> 22<sup>m</sup> [15, 4<sup>h</sup> 22<sup>m</sup>]. Surigao (NE de Mindanao). Temblor de tierra de intensidad III. Registrado en Butúan y originado en la bahía de este nombre.

18, 4<sup>h</sup> 15<sup>m</sup> [18, 12<sup>h</sup> 15<sup>m</sup>]. Borongan (E de Sámar). Temblor oscilatorio, intensidad III, duración 4 segundos.

19, 14<sup>h</sup> 21<sup>m</sup> 48<sup>s</sup>\* [19, 22<sup>h</sup> 21<sup>m</sup> 48<sup>s</sup>]. N de Luzón. Temblor de tierra de intensidad V-VI sentido principalmente en las provincias más septentrionales de Luzón: su origen parece se hallaba cerca del extremo norte de la cordillera central de Luzón. Fué perceptible en toda la porción de la isla que cae al N del paralelo 16° N. Registróse en Taihoku, Formosa.

21, 4<sup>h</sup> 4<sup>m</sup> [21, 12<sup>h</sup> 4<sup>m</sup>]. Ormoc (W de Leyte). Temblor oscilatorio, dirección SW-NE, intensidad IV, duración 10 segundos. Repitió a los pocos segundos con movimientos al parecer susultorios.

22, 5<sup>h</sup> 25<sup>m</sup> [22, 13<sup>h</sup> 25<sup>m</sup>]. Dávao (SE de Mindanao). Temblor de tierra de intensidad III en la parte E del Golfo de Dávao.

23, 11<sup>h</sup> 50<sup>m</sup> [23, 19<sup>h</sup> 50<sup>m</sup>]. Isabela (W de Negros). Temblor de tierra de intensidad III, sentido en una extensa región de la parte occidental de la Isla de Negros.

29, 5<sup>h</sup> 49<sup>m</sup> [29, 15<sup>h</sup> 28<sup>m</sup>]. Guam (Islas Marianas). Temblor de tierra de intensidad III, originado al parecer en el Pacífico hacia las Islas Palaos. Registrado en Manila a 5<sup>h</sup> 48<sup>m</sup>, en el Extremo Oriente y América.

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

## BULLETIN FOR SEPTEMBER, 1919.

# METEOROLOGICAL BULLETIN FOR SEPTEMBER, 1919.

By Rev. José Coronas, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure for this month in the Philippines is somewhat above the normal, the differences being greater in northern Luzon. The mean monthly temperature is slightly above the normal in about half of our stations, and slightly below in the other half. The extreme temperatures for Manila were 32.9° C. and 20.8° C.: they were registered on the 21st and 24th, respectively. The absolute highest and lowest temperatures for Baguio were 24.5° C., 14.7° C. on the top of Mirador, and 25.9° C., 14.3° C. in the valley.

### PRESSURE AND TEMPERATURE AT THE FIRST AND SECOND CLASS STATIONS FOR SEPTEMBER, 1919.

<sup>a</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—The monthly amount of rainfall of central and northern Luzon is considerably below that of the preceding year and below the normal of September, thus offering a great contrast with the abundant rains of last August. But in southeastern Luzon, in the Visayas and Mindanao the monthly rainfall is generally above that of last year, and in the majority of the stations it is also above the normal of this month. The total monthly amounts of rain for Manila and Baguio differ from the respective normals by -190.3 mm. and -414.2 mm.

## DEPRESSIONS AND TYPHOONS.

Not a single typhoon traversed the Philippines during this month, although a not very definite low-pressure area seems to have extended from northern Luzon to the China Sea from the 11th to the 14th while a well developed typhoon was recurving northeastward over the Pacific. Another low-pressure area seems to have moved from the China Sea southwest of Paracels to Indochina from the 20th to the 21st.

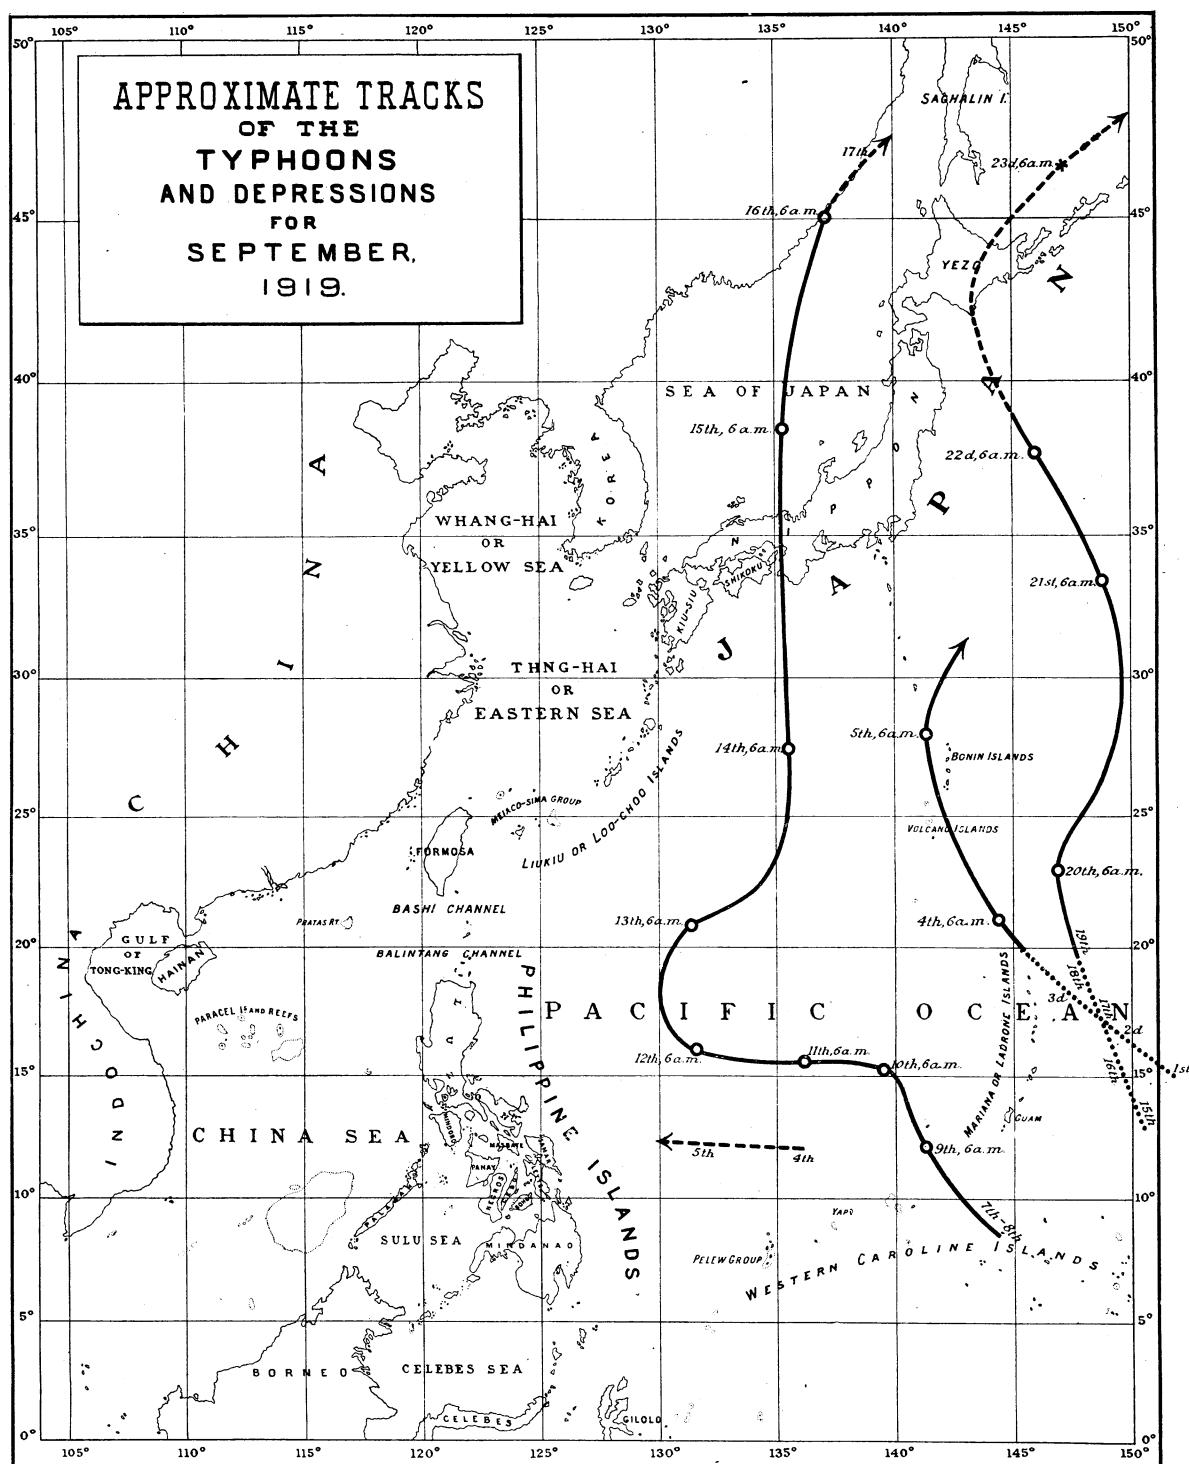

In the Pacific there were three typhoons during this month: their tracks are given in Plate VII. The first typhoon seems to have appeared on the 1st to the ENE of Guam in about  $153^{\circ}$  Longitude E and  $15^{\circ}$  Latitude N. It moved NW first, and then N toward the Bonin group of Islands, where the barometer was very low during the night of the 4th to the 5th. It probably recurved northeastward on the 5th and filled up on the next day N or NNE of the Bonins.

The second typhoon was formed on the 7th to 8th over the Western Carolines, south of Guam, in about  $144^{\circ}$  or  $145^{\circ}$  Longitude E and  $8^{\circ}$  or  $9^{\circ}$  Latitude N. According to the observations of Guam and Yap, the center of the typhoon passed between the two stations on the 9th moving NNW. On the 10th the typhoon began to move almost due west, this part of the track having been confirmed by observations made on board of the U. S. A. Transport *Thomas* on the way from Manila to Guam. Then on the 12th the typhoon recurred N and NE in about  $130^{\circ}$  Longitude E; but in the afternoon of the 13th it began to move with great speed straight N, thus reaching Japan in the evening of the 14th near  $135^{\circ}$  Longitude E.

The third typhoon seems to have appeared on the 15th to the east of Guam in about  $150^{\circ}$  Longitude E and  $12^{\circ}$  or  $13^{\circ}$  Latitude N. It moved northward remaining always very far from the Philippines.

Besides these three well developed typhoons, there was another depression or typhoon, likewise over the Pacific, which moved westward on the 4th to 5th, between  $130^{\circ}$  Longitude E and in about  $12^{\circ}$  or  $13^{\circ}$  Latitude N, to the east of northern Samar. It probably filled up on the 6th, a low-pressure area remaining afterward over the Philippines for the next two or three days.

*Plate VII.*

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media para este mes en Filipinas es algo superior a la normal, siendo las diferencias mayores las del norte de Luzón. La temperatura media mensual es algo superior a la normal en la mitad de nuestras estaciones y algo inferior en la otra mitad. Las temperaturas extremas para Manila fueron 32.9° C., y 20.8° C., habiendo sido registrados en los días 21 y 24, respectivamente. Las temperaturas absolutas máxima y mínima para Baguio fueron 24.5° C., 14.7° C. en la cumbre del Mirador, y 25.9° C., 14.3° C. en el valle.

**Lluvia.**—La cantidad mensual de lluvia en la parte central y norte de Luzón es considerablemente inferior a la del año precedente y a la normal de septiembre, resultando así un buen contraste con las lluvias abundantes del pasado agosto. Pero en la parte sudeste de Luzón, en Visayas y Mindanao la lluvia mensual es generalmente superior a la del año pasado, y en la mayoría de las estaciones es también superior a la normal de este mes. Las cantidades totales mensuales de lluvia para Manila y Baguio difieren de las respectivas normales en —190.3 mm. y —414.2 mm.

## DEPRESIONES Y TIFONES.

Ni un solo tifón cruzó las Islas este mes, aunque un área de baja presión no muy definida parece haberse extendido desde el norte de Luzón hasta el Mar de China del 11 al 14, mientras un tifón bien desarrollado estaba recurvando hacia el nordeste en el Pacífico. Otra área de baja presión parece haberse movido del 20 al 21 desde el Mar de China al sudoeste de Paracels a Indochina.

Hubo durante este mes tres tifones en el Pacífico, cuyas trayectorias pueden verse en la Lámina VII. El primer tifón parece haber aparecido el día 1.º al ENE de Guam cerca de 153° Longitud E y 15° Latitud N. Se movió al NW primero, y después al N en dirección al grupo de las Islas Bonín, donde el barómetro estuvo muy bajo durante la noche del 4 al 5. Recurvó probablemente al NE el día 5, y se deshizo el día siguiente al N o NNE de las Islas Bonín.

El segundo tifón se formó del 7 al 8 en las Carolinas Occidentales, al S de Guam, cerca de 144° ó 145° Longitud E y 8° ó 9° Latitud N. Según las observaciones de Guam y Yap, el centro del tifón pasó entre las dos estaciones el día 9 moviéndose al NNW. El día 10 comenzó el tifón a moverse casi en dirección oeste, habiéndose confirmado esta parte de la trayectoria con las observaciones hechas en el Transporte Americano *Thomas* en su viaje de Manila a Guam. Después recurvó el tifón al N y NE el día 12, cerca de 130° Longitud E; pero en la tarde del 12 comenzó a moverse con gran velocidad en dirección al N, llegando así al Japón en la tarde del 14 cerca de 135° Longitud E.

El tercer tifón parece haber aparecido el día 15 al E de Guam, cerca de 150° Longitud E y 12° ó 13° Latitud N. Se movió hacia el N permaneciendo siempre muy lejos de Filipinas.

Además de estos tres tifones bien desarrollados, hubo otra depresión o tifón, igualmente en el Pacífico, que se movió hacia el oeste del 4 al 5, entre 130° y 135° Longitud E y cerca de 12° ó 13° Latitud N, al E del norte de Sámar. Desapareció probablemente el día 6, permaneciendo después un área de baja presión sobre Filipinas durante los dos o tres días siguientes.

# SEISMOLOGICAL BULLETIN FOR SEPTEMBER, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

## EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

7, 23<sup>h</sup> 21<sup>m</sup> [8, 7<sup>h</sup> 21<sup>m</sup>]. Surigao (NE Mindanao). Oscillatory earthquake, direction WSW-ENE, intensity III-IV, duration 8 seconds. Apparently it originated in the Butuan Bay: it was recorded and very lightly felt also in that town.

10, 4<sup>h</sup> 39<sup>m</sup> 51<sup>s\*</sup> [10, 12<sup>h</sup> 39<sup>m</sup> 51<sup>s</sup>]. Paracale (SE Luzon). Oscillatory earthquake of intensity III. Its origin lay in the Pacific off the northern coast of Camarines.

12, 5<sup>h</sup> 55<sup>m</sup> [12, 13<sup>h</sup> 55<sup>m</sup>]. Cape Bojeador (NW Luzon). Earthquake of intensity III, very short duration.

14, 11<sup>h</sup> 22<sup>m</sup> [14, 19<sup>h</sup> 22<sup>m</sup>]. Cape Bojeador (NW Luzon). Oscillatory earthquake shock of intensity II-III.

16, 3<sup>h</sup> 25<sup>m</sup> [16, 11<sup>h</sup> 25<sup>m</sup>]. San Jose de Buenavista (SW Panay). Earthquake of intensity II-III.

19, 9<sup>h</sup> 46<sup>m</sup> 26<sup>s\*</sup> [19, 17<sup>h</sup> 46<sup>m</sup> 26<sup>s</sup>]. W Luzon. Extensive earthquake felt along the western coast of Luzon from Ilocos Norte to Zambales, an extension of more than 400 kilometers: it had only intensity III-IV. The origin lay in the China Sea off the coast. From the Zambales province was reported an aftershock at 10<sup>h</sup> 5<sup>m</sup> [18<sup>h</sup> 5<sup>m</sup>].

21, 4<sup>h</sup> 3<sup>m</sup> 34<sup>s\*</sup> [21, 12<sup>h</sup> 3<sup>m</sup> 34<sup>s</sup>]. Davao (SE Mindanao). Earthquake of intensity IV, felt chiefly in the northern part of Davao Gulf. Recorded also at Butuan.

22, 23<sup>h</sup> 50<sup>m</sup> [23, 7<sup>h</sup> 50<sup>m</sup>]. Veruela (E Mindanao). Earthquake of intensity III, felt in the southern part of the Agusan Valley. Recorded at Butuan.

23, 13<sup>h</sup> 46<sup>m</sup> 39<sup>s\*</sup> [23, 21<sup>h</sup> 46<sup>m</sup> 39<sup>s</sup>]. W Luzon. Earthquake of intensity III-IV, with many aftershocks during the following hours. It was felt along the Zambales province, the origin being off the coast in the China Sea.

26, 9<sup>h</sup> 7<sup>m</sup> 34<sup>s\*</sup> [26, 17<sup>h</sup> 7<sup>m</sup> 34<sup>s</sup>]. NW Luzon. Extensive and heavy earthquake, which had its epicenter in Ilocos Sur, shaking the same region affected by the earthquake of June 25th.<sup>2</sup> It reached intensity VII, causing some damage to the masonry buildings of the Capital, Vigan, and other towns of that province. The main cracks produced in walls and the displacements of some blocks of masonry indicate that the stronger movements had an W-E direction. Numerous aftershocks occurred during the following night. The earthquake was perceptible through the main part of Luzon Island north of the 13° N parallel. It was recorded at Taihoku, Formosa, and in other stations of the Far East and America.

On the afternoon of the 28th, between 14<sup>h</sup> and 22<sup>h</sup> I. T. a series of seven light shocks occurred in the epicentral region. About the probable origin and cause of the Ilocos shocks may be seen the Bulletin for June quoted above.

26, 19<sup>h</sup> 42<sup>m</sup> 0<sup>s\*</sup> [27, 3<sup>h</sup> 42<sup>m</sup> 0<sup>s</sup>]. Central Mindanao. At this hour there began a series of earthquake shocks in the central and western Mindanao. Their origin was probably in the Celebes Sea south of Illana Bay. In the Lanao province, the most affected, not less of seventeen shocks of intensity V-VI were felt; the strongest noticeable through the whole island occurred at 3<sup>h</sup> 42<sup>m</sup>, 3<sup>h</sup> 51<sup>m</sup>, 5<sup>h</sup> 41<sup>m</sup>, 6<sup>h</sup> 51<sup>m</sup> and 8<sup>h</sup> 55<sup>m</sup> I. T. They were recorded at Taihoku, Formosa. The seismograph at Butuan recorded 18 disturbances during the same day.

30, 19<sup>h</sup> 17<sup>m</sup> [Oct. 1, 3<sup>h</sup> 17<sup>m</sup>]. Cape Bojeador (NW Luzon). Earthquake of intensity III, duration 2 seconds.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismographs at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

<sup>2</sup> See "Bulletin for June, 1919."

## RECORDS OF THE MICROSEISMOGRAPH.

[Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.25, \epsilon=2.906, \frac{r}{T_0^2}=0.053;$   
 $A_E: T_0=6.18, \epsilon=2.393, \frac{r}{T_0^2}=0.042.$  Alluvium. 2.40 meters above sea level.]

TEMBLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

7, 23<sup>h</sup> 21<sup>m</sup> [8, 7<sup>h</sup> 21<sup>m</sup>]. Surigao (NE de Mindanao). Temblor oscilatorio, dirección WSW-ENE, intensidad III-IV, duración 8 segundos. Al parecer se originó en la bahía de Butúan y fué registrado y muy débilmente sentido en esta estación y su comarca.

10, 4<sup>h</sup> 39<sup>m</sup> 51<sup>s\*</sup> [10, 12<sup>h</sup> 39<sup>m</sup> 51<sup>s</sup>]. Paracale (SE de Luzón). Temblor oscilatorio de intensidad III: originado en el mar Pacífico al N de la costa de Camarines.

12, 5<sup>h</sup> 55<sup>m</sup> [12, 13<sup>h</sup> 55<sup>m</sup>]. Cabo Bojeador (NW de Luzón). Temblor de tierra de intensidad III, duración muy corta.

14, 11<sup>h</sup> 22<sup>m</sup> [14, 19<sup>h</sup> 22<sup>m</sup>]. Cabo Bojeador (NW de Luzón). Temblor oscilatorio de intensidad II-III.

16, 3<sup>h</sup> 25<sup>m</sup> [16, 11<sup>h</sup> 25<sup>m</sup>]. San José de Buenavista (SW de Panay). Temblor de tierra de intensidad II-III.

19, 9<sup>h</sup> 46<sup>m</sup> 26<sup>s\*</sup> [19, 17<sup>h</sup> 46<sup>m</sup> 26<sup>s</sup>]. W de Luzón. Extenso temblor de tierra sentido a lo largo de la costa occidental de Luzón desde Ilocos hasta Zambales, en una extensión de N a S de más de 400 kilómetros: no pasó de intensidad III-IV. El origen se hallaba algo distante en el Mar de China. En Zambales se experimentó una repetición a 10<sup>h</sup> 5<sup>m</sup> [18<sup>h</sup> 5<sup>m</sup>].

21, 4<sup>h</sup> 3<sup>m</sup> 34<sup>s\*</sup> [21, 12<sup>h</sup> 3<sup>m</sup> 34<sup>s</sup>]. Dávao (SE de Mindanao). Temblor de tierra de intensidad IV sentido principalmente en la parte N del Golfo de Dávao. Registrado también en Butúan.

22, 23<sup>h</sup> 50<sup>m</sup> [23, 7<sup>h</sup> 50<sup>m</sup>]. Veruela (E de Mindanao). Temblor de tierra de intensidad III, en la parte sur del Valle del Agusan. Registrado en Butúan.

23, 13<sup>h</sup> 46<sup>m</sup> 39<sup>s\*</sup> [23, 21<sup>h</sup> 46<sup>m</sup> 39<sup>s</sup>]. W de Luzón. Temblor de tierra de intensidad III-IV seguido de varias repeticiones durante las dos horas siguientes. Sintióse a lo largo de las costas de Zambales: el origen se hallaba algo lejos en el Mar de China.

26, 9<sup>h</sup> 7<sup>m</sup> 34<sup>s\*</sup> [26, 17<sup>h</sup> 7<sup>m</sup> 34<sup>s</sup>]. NW de Luzón. Extenso y fuerte terremoto el cual tuvo su epicentro en la Provincia de Ilocos Sur en la misma región que el terremoto del 25 de Junio último.<sup>2</sup> Tuvo intensidad VII, causando pequeños desperfectos en los edificios de mampostería de la capital, Vigan, y otros pueblos de la provincia. A juzgar por las grietas de las paredes y los desplazamientos de algunas masas de mampostería, los movimientos principales tenían una dirección de W a E. Siguiéronse numerosas repeticiones de poca intensidad durante la noche siguiente. Este terremoto fué perceptible en toda la parte central de la isla de Luzón o sea desde el paralelo 13° hacia el N. Registróse en Formosa y seguramente en otras estaciones del Extremo Oriente y América.

En la tarde del 28, de 14<sup>h</sup> a 22<sup>h</sup> T. I., se experimentó en la región epicentral de este terremoto una serie de siete choques de poca intensidad. Sobre el origen probable de estos temblores véase el Boletín de junio.

26, 19<sup>h</sup> 42<sup>m</sup> 0<sup>s\*</sup> [27, 3<sup>h</sup> 42<sup>m</sup> 0<sup>s</sup>]. Centro de Mindanao. A esta hora comenzó una serie de temblores de tierra sentidos en la parte central y oeste de Mindanao. Su origen probablemente se hallaba en el Mar de Célebes al S de la bahía Illana. En la Provincia de Lánao se contaron hasta 17 diferentes temblores; los más fuertes, de intensidad V-VI, sentidos en toda la Isla de Mindanao tuvieron lugar a 3<sup>h</sup> 42<sup>m</sup>, 3<sup>h</sup> 51<sup>m</sup>, 5<sup>h</sup> 41<sup>m</sup>, 6<sup>h</sup> 51<sup>m</sup> y 8<sup>h</sup> 55<sup>m</sup> T. I. Registráronse también en el Observatorio de Taihoku, Formosa. El sismógrafo de Butúan registró 18 choques durante el mismo tiempo.

30, 19<sup>h</sup> 17<sup>m</sup> [Oct. 1, 3<sup>h</sup> 17<sup>m</sup>]. Cabo Bojeador (NW de Luzón). Temblor de tierra de intensidad III, duración 2 segundos.

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

**BULLETIN FOR OCTOBER, 1919.**

# METEOROLOGICAL BULLETIN FOR OCTOBER, 1919.

By Rev. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure of this month is, with a few exceptions, slightly above the normal of October. The lowest pressures were generally observed on the 10th in northern Luzon, and on the 14th in the rest of the Archipelago. The highest pressures were recorded in the majority of our stations on the 27th.

The mean monthly temperature differs very little from the normal of this month. The absolute maximum and minimum temperatures for Manila were 32.5° C. on the 16th, and 21.6° C. on the 1st and 24th. The extreme temperatures for Baguio were 24.3° C., 15.1° C. on the top of Mirador, and 25.7° C., 14.3° C. in the valley.

<sup>a</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—The monthly amount of precipitation is generally above that of the preceding year, and also above the October's normal, in southern Luzon, the Visayas and Mindanao, while it is below the same in northern Luzon. The total monthly rainfall for Manila is 357.3 mm., the difference from the normal being + 164.2 mm. That of Baguio is 196 mm., and it differs from the the normal by -211.5. The daily amounts of rainfall above 300 mm. observed in the stations of Surigao, Butuan, La Castellana and Isabela (Occidental Negros), during the typhoon of October 14, is worth mentioning.

## RAINFALL AT VARIOUS STATIONS OF THE WEATHER BUREAU DURING THE MONTH OF OCTOBER, 1919.

Station.	Total. mm.	Departure from October, 1918. mm.	Departure from normal. mm.	Days of rain.	Departure from October, 1918. mm.	Greatest rainfall in a single day. mm.	Day.	Station.	Total. mm. <sup>a</sup> 27 days of observation only.

## DEPRESSIONS AND TYPHOONS.

Three typhoons and one depression were observed during this month in the Far East: two typhoons in the Pacific; one typhoon in the Visayas, and one depression in the China Sea. Their tracks are given in Plate VIII.

Pacific typhoon: September 29 to October 9, 1919.—The observations of Guam show this typhoon as forming to the SSW or SW of that station on the 28th to 29th. It moved WNW until the 2nd of October when it began to incline northward. According to observations made on board of one steamer that happened to be near the cyclonic center, the typhoon was much developed, at least while it was moving northward to the east of the Loochoos. Yet, after recurring northeastward on the 5th, it seems that it soon filled up to the southeast of Japan.

The following typhoon warnings were sent out by Manila Observatory concerning this typhoon.

September 29, 10 a. m. Typhoon south of Guam (Mariana Islands) moving WNW.

September 30, 12.45 p. m. Typhoon north of Yap (Western Carolines) moving WNW.

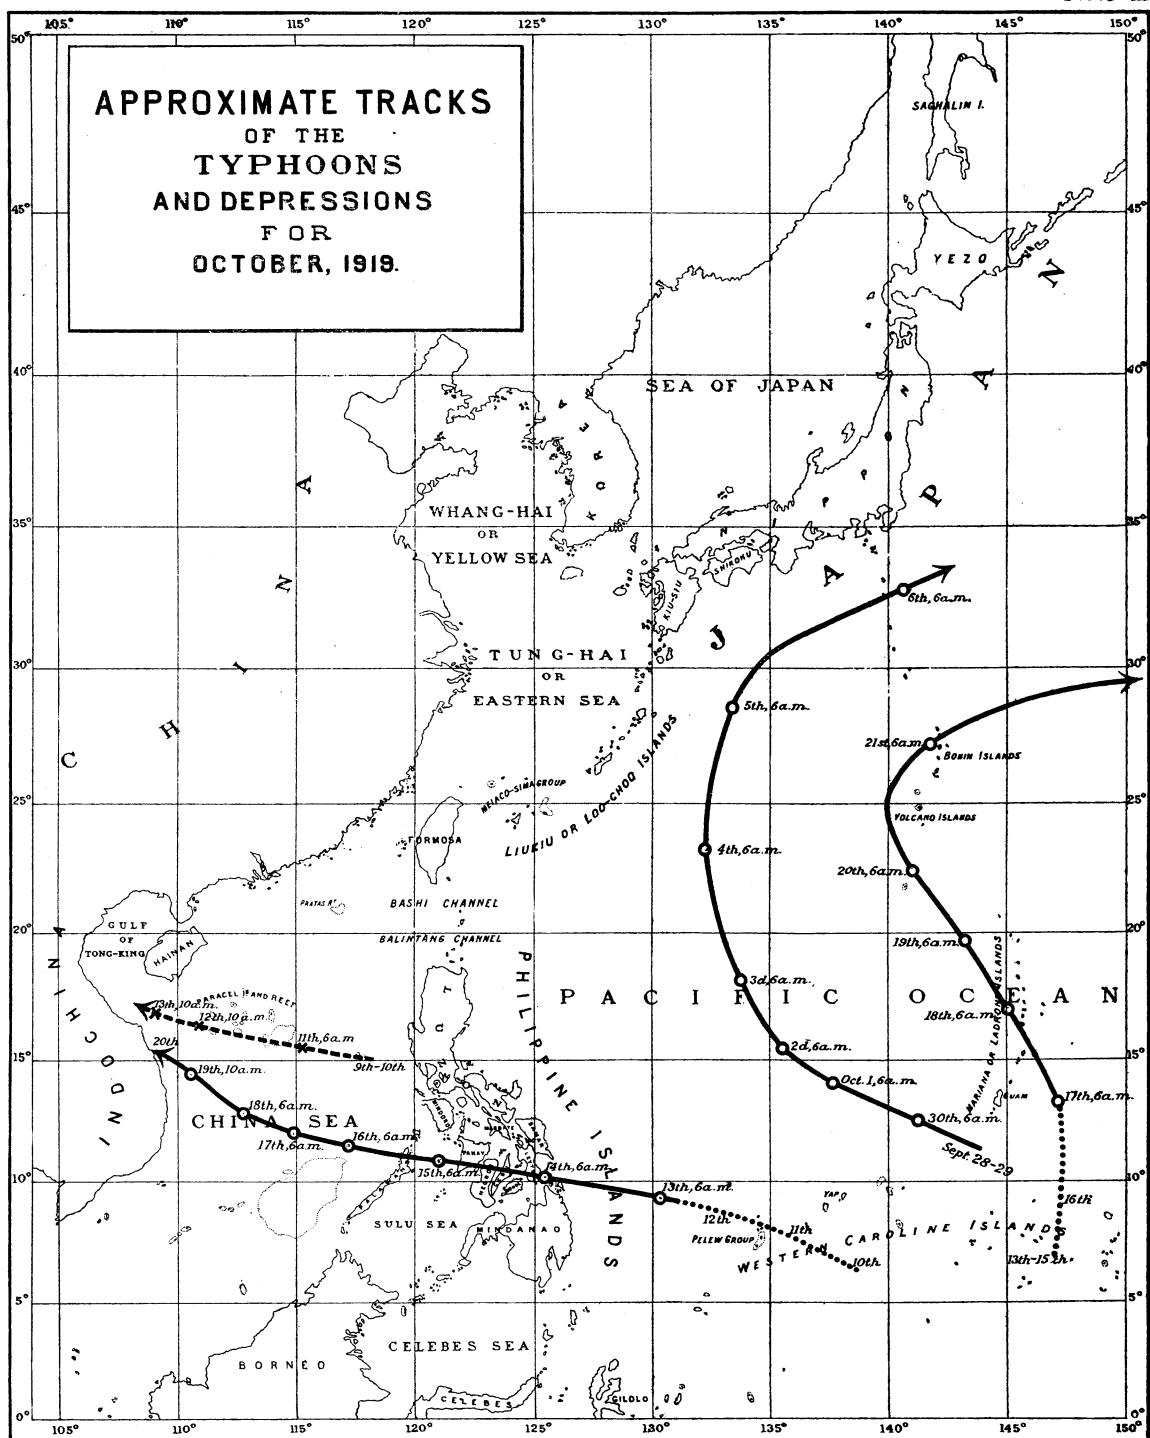

October 2, 11.30 a. m. Typhoon Pacific Ocean about halfway between the Mariana Islands and Luzon, almost stationary.

October 3, 3 p. m. Typhoon Pacific Ocean, about halfway between the Mariana Islands and Luzon, inclining northward.

October 3, 7 p. m. Typhoon in about 134° longitude E and 19° latitude N, moving north.

Depression in the China Sea: October 9 to 12, 1919.—As it was announced by Manila Observatory in the weather report for October 9th, "a low-pressure area of little importance crossed the Philippines on the 8th, it being situated in the morning of the 9th over the China Sea, west of Luzon." There it developed into a real depression which moved westward from the 10th to the 13th, when it filled up between Hainan and Indochina.

Plate VIII.

Typhoon of the Visayas: October 10 to 20, 1919.—The observations of Yap gave slight indications of a depression or typhoon to the south or southwest of that station on the 10th and 11th. The following statement was given out by Manila Observatory in the afternoon of the 13th:

October 13, 4 p. m. There seems to be a depression or typhoon over the Pacific east of the Visayas or of northern Mindanao moving W or WNW.

This typhoon was very small, and so its center was already in the Philippines at 6 a. m. of the next day, close to the southernmost part of Leyte. It moved almost due west across the Visayas, the center passing north of Cebu, and very close to the south of Iloilo and San Jose de Buenavista. Great damage was done in the towns situated in or near the path of the storm, not so much by strong winds, as by heavy rains and consequent floods. Reports from San Jose de Buenavista, however, show that considerable damage was done there also by hurricane winds from the southeast quadrant. The typhoon inclined somewhat to the north in the China Sea and moved very slowly after the 16th, entering Indo-china south of Tourane on the 21st.

The Ladrones and Bonins typhoon: October 13 to 22, 1919.—This was a well developed and severe typhoon, although, owing to its great distance, it did not influence at all the weather of the Philippines. The first part of its track is given only as probable although it is based on the inconsistency with which the winds at Guam were observed blowing from the NE up to 2 p. m. of the 16th. The typhoon passed to the NE and N of Guam on the 17th and 18th moving NNW across the central part of the Ladrone or Mariana Islands. The barometric minimum at Guam was 747.7 mm., and the winds backed from the NE to the N, NNW, W and SW. In the afternoon of the 20th the typhoon recurved northeastward to the southwest of the Bonins, and thus its center came to pass over those Islands, where the barometer at 6 a. m. of the 21st was as low as 723 mm. (gravity correction not applied).

Manila Observatory sent out the following typhoon warnings on the 16th to 20th.

October 16, 9.30 a. m. Typhoon in about  $145^{\circ}$  longitude E and  $10^{\circ}$  latitude N: direction unknown.

October 17, 11.15 a. m. Typhoon near or over Guam (Mariana Islands): direction unknown.

October 18, 10.45 a. m. Typhoon in about  $145^{\circ}$  longitude E and  $16^{\circ}$  latitude N, moving NW.

October 19, noon. Typhoon near or over the northern Mariana Islands, moving NNW.

October 20, 3.30 p. m. Typhoon S of the Bonin Islands, moving north.

## NOTAS GENERALES DEL TIEMPO.

Presión y temperatura.—La presión atmosférica media de este mes es, con raras excepciones, ligeramente mayor que la normal de octubre. Las presiones más bajas se observaron generalmente el día 10 en el norte de Luzón, y el 14 en el resto del Archipiélago. Las presiones más altas se registraron en la mayoría de nuestras estaciones el día 27.

La temperatura media mensual difiere muy poco de la normal de este mes. Las temperaturas máxima y mínima absolutas de Manila fueron  $32.5^{\circ}$  C., que tuvo lugar el día 16, y  $21.6^{\circ}$  C., que se observó los días 1 y 24. Las temperaturas extremas de Baguio fueron  $24.3^{\circ}$  C.,  $15.1^{\circ}$  C. en la cumbre del Mirador, y  $25.7^{\circ}$  C.,  $14.3^{\circ}$  C. en el valle.

Precipitación acuosa.—La cantidad mensual de la precipitación acuosa es en general mayor que la del año pasado, y mayor también que la normal de octubre, en el sur de Luzón en Visayas y Mindanao, al paso que es menor en el norte de Luzón. La lluvia total del mes en Manila es 357.3 mm., la cual difiere de la normal en +164.2 mm. La de Baguio es 196 mm., y difiere de la normal en -211.5 mm. Merecen mencionarse las cantidades diarias de lluvia mayores de 300 mm. observadas en las estaciones de Surigao, Butúan, La Castellana e Isabela (Negros Occidental), durante el baguio del 13 de octubre.

## DEPRESIONES Y TIFONES.

Tres tifones y una depresión se observaron durante este mes en el Extremo Oriente: dos tifones en el Pacífico; un tifón en Visayas y una depresión en el Mar de China. Pueden verse sus trayectorias en la Lámina VIII.

El tifón del Pacífico: 29 de septiembre a 6 de octubre, 1919.—Las observaciones de Guam muestran que este tifón estuvo formándose al SSW o SW de aquella estación del 28 al 29. Se movió al WNW hasta el 2 de octubre en que comenzó a inclinarse al norte. Según las observaciones hechas a bordo de un vapor que se encontró cerca del centro ciclónico, el tifón estaba muy desarrollado, por lo menos mientras corría hacia el norte por el E de Loochoos. Con todo, después de recurrvar al NE el día 5, parece que se deshizo pronto al SE de Japón.

El Observatorio de Manila despachó los siguientes avisos referentes a este tifón:

Septiembre 29, 10 a. m. Tifón al S de Guam (Islas Marianas), moviéndose al WNW.

Septiembre 30, 12.45 p. m. Tifón al N de Yap (Carolinas Occidentales), moviéndose al WNW.

Octubre 2, 11.30 a. m. Tifón en el Pacífico, a la mitad de camino entre las Islas Marianas y Luzón, casi estacionario.

Octubre 3, 3 p. m. Tifón en el Océano Pacífico, a la mitad de camino entre las Islas Marianas y Luzón, inclinándose al norte.

Octubre 3, 7 p. m. Tifón en los alrededores de  $134^{\circ}$  longitud E y  $19^{\circ}$  latitud N, moviéndose al norte.

La depresión del Mar de China: 9 a 12 de octubre, 1919.—Como anunció el Observatorio de Manila en la nota del tiempo de 9 de octubre, "un área de baja presión de poca importancia atravesó las Filipinas el día 8, hallándose la mañana del 9 en el Mar de China al W de Luzón." Allí se desarrolló hasta llegar a ser una verdadera depresión que se movió al W, desde el día 10 hasta el 13, en que se deshizo entre Hainán e Indochina.

El tifón de Visayas: 10 a 20 de octubre, 1919.—Las observaciones de Yap dan ligeras indicaciones de una depresión o tifón al S o SW de aquella estación los días 10 y 11. La siguiente nota la publicó el Observatorio de Manila la tarde del día 13:

Octubre 13, 4 p. m. Parece existir una depresión o tifón en el Pacífico al E. de Visayas o del Norte de Mindanao, moviéndose al WNW.

El tifón era muy pequeño, y así su centro se hallaba ya en Filipinas a las 6 a. m. del día siguiente cerca del extremo meridional de Leyte. Se movió casi directamente al

W a través de Visayas, pasando su centro por el N de Cebú y muy cerca por el S de Iloílo y San José de Buenavista. Grandes daños experimentaron los pueblos que se hallaron en el, o cerca, del, paso del temporal, no tanto por los vientos duros como por las torrenciales lluvias y consiguientes inundaciones. Informes recibidos de San José de Buenavista, sin embargo, indican que también los vientos huracanados del cuadrante del S E causaron allí considerable daño. El tifón se inclinó algo al N en el Mar de China y se movió muy lentamente después del día 16, penetrando en Indochina por el S de Tournane el día 21.

**El tifón de las Islas Ladrones y Boníns: 13 a 22 de octubre, 1919.**—Este fué un tifón intenso y bien desarrollado, aunque, debido a su gran distancia, no llegó a influir en el tiempo de Filipinas. La primera parte de su trayectoria se da sólo como probable a pesar de estar basada en la persistencia con que los vientos en Guam soplaron del NE hasta las 2 p. m. del día 16. El tifón pasó por el NE y N de Guam los días 17 y 18, moviéndose al NNW a través de la parte central de las Islas Ladrones o Marianas. La mínima barométrica registrada en Guam fué 747.7 mm., y los vientos roilaron del NE al N, NNW, W y SW. La tarde del 20 el tifón recurvó al NE por el SW de Boníns, y así su centro llegó a cruzar dichas Islas en donde el barómetro marcaba a las 6 a. m. del 21, 723 mm. (sin aplicar la corrección por gravedad).

El Observatorio de Manila despachó los siguientes avisos de tifón los días 16 al 20:

Octubre 16, 9.30 a. m. Tifón en los alrededores de 145° longitud E y 10° latitud N: dirección desconocida.

Octubre 17, 11.15 a. m. Tifón en, o cerca de, Guam (Islas Marianas): dirección desconocida.

Octubre 18, 10.45 a. m. Tifón en los alrededores de 145° longitud E y 16° latitud N, moviéndose al NW.

Octubre 19, 12 md. Tifón en, o cerca de, la parte norte de las Islas Marianas, moviéndose al WNW.

Octubre 20, 3.30 p. m. Tifón al S de las Islas Boníns, moviéndose al norte.

METEOROLOGICAL DATA FOR MANILA CENTRAL OBSERVATORY.<sup>a</sup>[ $\phi = 14^\circ 34' 41'' N$ ;  $\lambda = 120^\circ 58' 33'' E$ ; barometer above sea, 14.2 meters; gravity correction not applied, -1.72 mm.]

All the mean values given in this table are deduced from six daily observations taken at 2, 6, 10 a. m. and 2, 6, 10 p. m.

<sup>a</sup> All the mean values given in this table are deduced from six daily observations.

<sup>c</sup> Maximum of hourly observations taken from 6 a. m. to 6 p. m.

<sup>a</sup>This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

## SEISMOLOGICAL BULLETIN FOR OCTOBER, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

- 1, 13<sup>h</sup> 55<sup>m</sup> [1, 21<sup>h</sup> 55<sup>m</sup>]. Candon (NW Luzon). Earthquake of intensity III.
- 2, 1<sup>h</sup> 8<sup>m</sup> [2, 9<sup>h</sup> 8<sup>m</sup>]. Butuan (N Mindanao). Oscillatory earthquake, direction N-S, intensity III, duration 2 seconds.
- 3, 2<sup>h</sup> 13<sup>m</sup> [3, 10<sup>h</sup> 13<sup>m</sup>]. Port Lebak (SW Mindanao). Earthquake of intensity III. It was recorded by the seismograph at Butuan.
- 5, 8<sup>h</sup> 24<sup>m</sup> [5, 16<sup>h</sup> 24<sup>m</sup>]. Candon (NW Luzon). Earthquake of intensity III.
- 6, 5<sup>h</sup> 53<sup>m</sup> [6, 13<sup>h</sup> 53<sup>m</sup>]. Port Lebak (SW Mindanao). Earthquake of intensity III. It was registered at Butuan.
- 8, 5<sup>h</sup> 11<sup>m</sup> 16<sup>s</sup> \* [8, 13<sup>h</sup> 11<sup>m</sup> 16<sup>s</sup>]. SE Luzon, Masbate and Samar. Extensive earthquake felt in the provinces of Camarines, Albay and Sorsogon and in the islands of Masbate and Samar; its intensity did not pass No. IV of the scale: the origin seems to have been in the San Bernardino Strait. It was registered at Butuan.
- 13, 5<sup>h</sup> 38<sup>m</sup> 12<sup>s</sup> \* [13, 13<sup>h</sup> 38<sup>m</sup> 12<sup>s</sup>]. Central Mindanao. Earthquake felt in the provinces of Lanao, Bukidnon, Agusan, Cotabato, Misamis and Davao. It had intensity IV-V in Davao, IV in Butuan and II-III in Cagayan, Cotabato and Bukidnon. The epicenter was probably near to S Mindanao and E of Celebes Sea. It was registered at Batavia.
- 15, 19<sup>h</sup> 22<sup>m</sup> [16, 3<sup>h</sup> 22<sup>m</sup>]. Surigao (NE Mindanao). Oscillatory earthquake, direction WSW-ENE, intensity III, duration 5 seconds. It was recorded only by the seismograph at Butuan.
- 16, 21<sup>h</sup> 30<sup>m</sup> [17, 5<sup>h</sup> 30<sup>m</sup>]. Candon (NW Luzon). Earthquake of intensity II-III.
- 23, 5<sup>h</sup> 7<sup>m</sup> [23, 14<sup>h</sup> 37<sup>m</sup>]. Yap (Western Carolines). Earthquake of intensity III.
- 23, 11<sup>h</sup> 20<sup>m</sup> [23, 19<sup>h</sup> 20<sup>m</sup>]. Port Lebak (SW Mindanao). Earthquake of intensity II-III.

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismograph at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), Insular time being added in brackets for Philippine readers.

## RECORDS OF THE MICROSEISMOGRAPH.

(Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.25$ ,  $\epsilon=2.906$ ,  $\frac{r}{T_0^2}=0.058$ ;  $A_E: T_0=6.18$ ,  $\epsilon=2.393$ ,  $\frac{r}{T_0^2}=0.042$ . Alluvium. 2.40 meters above sea level).

TEMBOLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

1, 13<sup>h</sup> 55<sup>m</sup> [1, 21<sup>h</sup> 55<sup>m</sup>]. Candón (NW de Luzón). Temblor de tierra de intensidad III.

2, 1<sup>h</sup> 8<sup>m</sup> [2, 9<sup>h</sup> 8<sup>m</sup>]. Butúan (N de Mindanao). Temblor oscilatorio, dirección N-S, intensidad III, duración 2 segundos.

3, 2<sup>h</sup> 13<sup>m</sup> [3, 10<sup>h</sup> 13<sup>m</sup>]. Port Lebak (SW de Mindanao). Temblor de tierra de intensidad III. Registrado en Butúan.

5, 8<sup>h</sup> 24<sup>m</sup> [5, 16<sup>h</sup> 24<sup>m</sup>]. Candón (NW de Luzón). Temblor de tierra de intensidad III.

6, 5<sup>h</sup> 53<sup>m</sup> [6, 13<sup>h</sup> 53<sup>m</sup>]. Port Lebak (SW de Mindanao). Temblor de tierra de intensidad III. Registrado en Butúan.

8, 5<sup>h</sup> 11<sup>m</sup> 16<sup>s</sup>\* [8, 13<sup>h</sup> 11<sup>m</sup> 16<sup>s</sup>\*]. SE de Luzón, Masbate y Sámar. Extenso temblor de tierra sentido en las provincias de Camarines, Albay y Sorsogón y en las islas de Masbate y Sámar; su intensidad no pasó del grado IV: el epicentro parece se hallaba en el Estrecho de San Bernardino. Fué registrado en Butúan.

13, 5<sup>h</sup> 38<sup>m</sup> 12<sup>s</sup>\* [13, 13<sup>h</sup> 38<sup>m</sup> 12<sup>s</sup>\*]. Centro de Mindanao. Temblor de tierra sentido en las provincias de Lanao, Bukidnon, Agusan, Cotabato, Misamis y Dávao. Tuvo intensidad IV-V en Dávao, IV en Butúan, y II-III en Cagayán, Cotabato y Bukidnon. Su origen se hallaba probablemente cerca del S de Mindanao y E del mar de Célebes. Registróse en Batavia.

15, 19<sup>h</sup> 22<sup>m</sup> [16, 3<sup>h</sup> 22<sup>m</sup>]. Surigao (NE de Mindanao). Temblor oscilatorio, dirección WSW-ENE, intensidad III, duración 5 segundos. Fué registrado solamente en Butúan.

16, 21<sup>h</sup> 30<sup>m</sup> [17, 5<sup>h</sup> 30<sup>m</sup>]. Candón (NW de Luzón). Temblor de tierra de intensidad II-III.

23, 5<sup>h</sup> 7<sup>m</sup> [23, 14<sup>h</sup> 37<sup>m</sup>]. Yap (Carolinas Occidentales). Temblor de tierra de intensidad III.

23, 11<sup>h</sup> 20<sup>m</sup> [23, 19<sup>h</sup> 20<sup>m</sup>]. Port Lebak (SW de Mindanao). Temblor de tierra de intensidad II-III.

---

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

## **BULLETIN FOR NOVEMBER, 1919.**

# METEOROLOGICAL BULLETIN FOR NOVEMBER, 1919.

By Rev. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau.*

## GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure of this month for the Philippines is moderately below that of November, 1918, and slightly below the normal of this month. The highest pressures were generally observed on the 23 and 25, and the lowest on the 11th or 16th.

The mean monthly temperature is either identical with the normal of November or slightly below it. The absolute maximum and minimum temperatures for Manila were 33.3° C. and 19.2° C.: they were registered on the 4th and 26th, respectively. The extreme monthly values for Baguio were 26.2° C., 11.4° C. on the top of Mirador, and 26.9° C., 10.9° C. in the valley.

a The barometric readings of this station are not reduced to sea level.

**Rainfall.**—The total amount of rainfall for this month in the Philippines is without a single exception greater than that of the preceding year, although it is generally below the November's normal in the northern part of Luzon. The monthly rainfall for Manila differs from that of November, 1918, by +126.7 mm., and from the normal by +10.3 mm., while that of Baguio is 52.1 mm. above that of the preceding year, and 23.1 mm. below the normal. Maximum daily amounts of rain of over 100 mm. were observed in several stations of southeastern Luzon and the eastern Visayas during the typhoon of the 16-17 of this month.

<sup>a</sup> Rain for 13 and 14.

## DEPRESSIONS AND TYPHOONS.

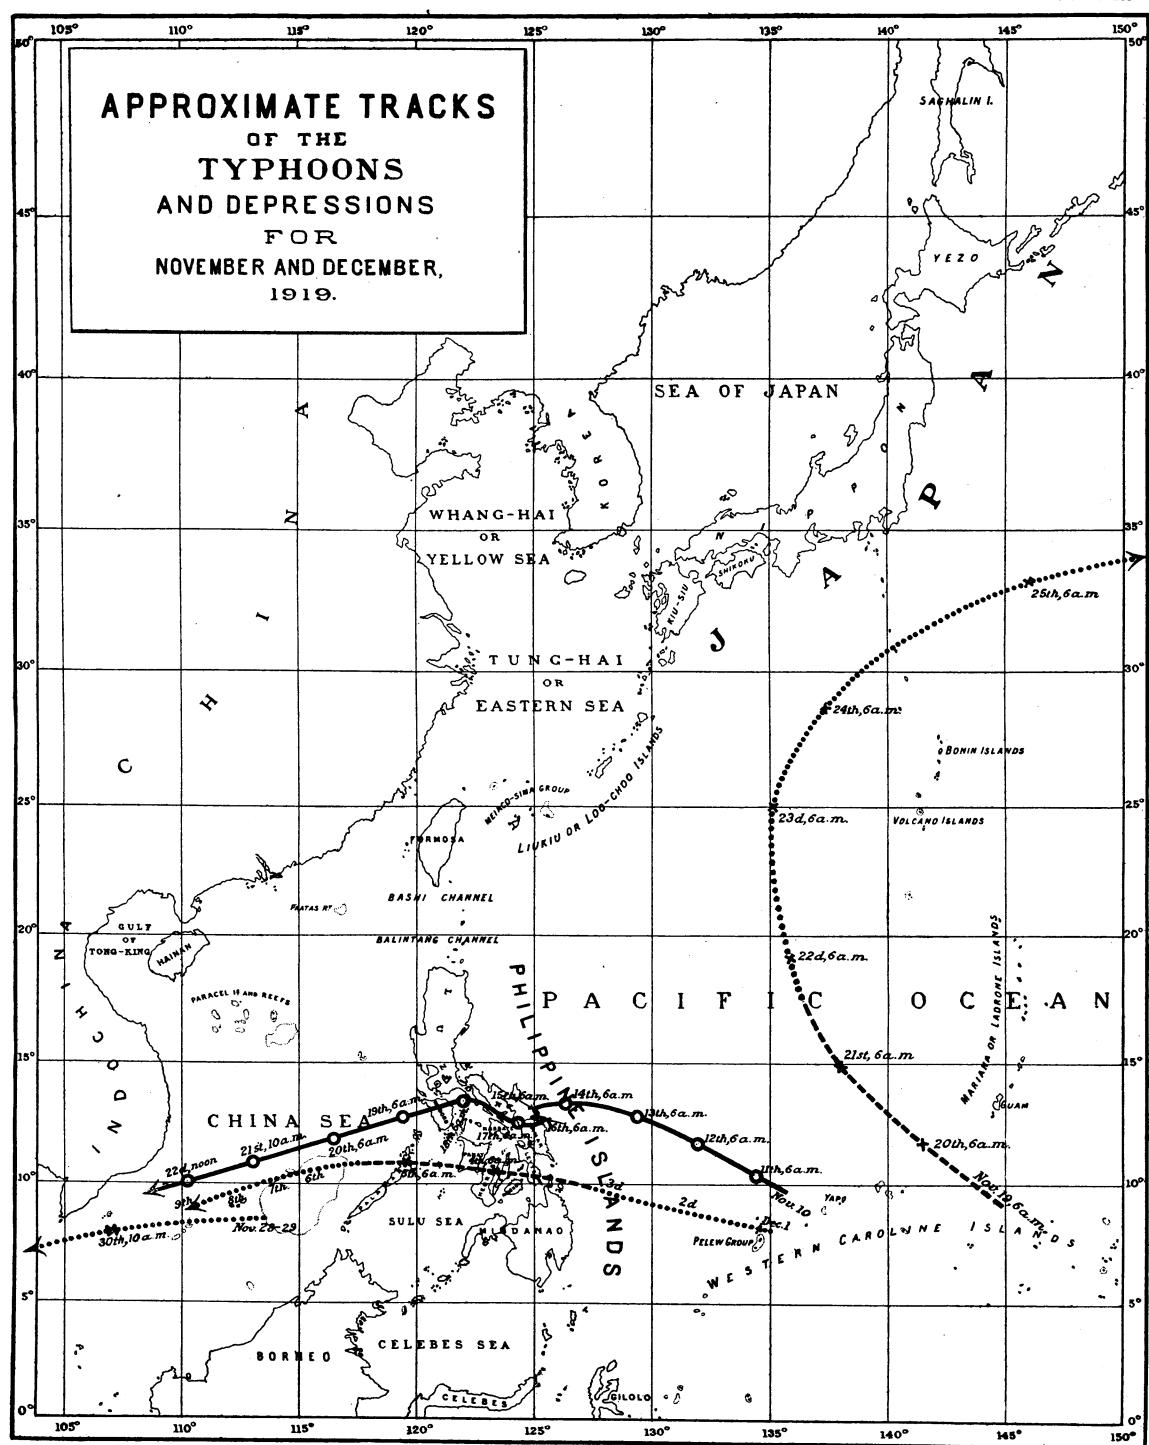

There was only one typhoon over the Philippines during this month. It was probably formed on the 10th to the west of Yap and moved WNW until the 13th when it inclined more to the west.

Beginning with the 14th the typhoon followed so an abnormal track as it is hardly ever observed in the Philippines. This track as it is given in Plate IX is based on many reliable observations which can hardly leave any doubt on its accuracy. We consider it so important, especially for shipmasters, to realize that a typhoon can, absolutely speaking, not only incline to SW, but also recurve to the S and even E, and then take up again its normal course to W and NW, as it happened in this case, that we have decided to study this typhoon more in detail in a separate pamphlet or in the annual appendix of these monthly bulletins. Hence we will only say at present that the typhoon after three sharp recurvings that took place near Batag Island on the 15th and 16th, it moved northwestward on the 17th along the western coast of southeastern Luzon, and then on the 18th it took an WSW direction across Mindoro and the China Sea. Considerable damage was done by the storm particularly in northern Samar, southeastern Luzon, Marinduque and Mindoro.

The two steamers *San Nicolas* and *Laensamud* were caught near the center of this typhoon: the former in Masagasai Bay on the eastern part of Marinduque, and the latter in the southern part of the China Sea. The interesting reports of observations made on board of them will be published latter.

On the 19th a depression appeared over the Western Carolines, to the south of Guam. It moved northwestward, the center being situated on the 20th about half way between Guam and Yap, both stations giving about the same barometric readings. It seems that the depression recurved northeastward on the 22nd, but lack of observations prevents us from giving as certain this last part of the track of this typhoon.

On the 28th to 30th there were signs of another depression, probably of little importance, moving westward northwest of Borneo and south of Indochina.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes en Filipinas es moderadamente menor que la de noviembre de 1918, y ligeramente menor que la normal de este mes. Las presiones más altas se observaron generalmente del 23 al 25, y las más bajas el día 11 ó el 16.

La temperatura media mensual es idéntica a la normal de noviembre o ligeramente menor que ella. Las temperaturas máxima y mínima absolutas del mes en Manila fueron 33.3° C. y 19.2° C., las cuales se registraron los días 4 y 26, respectivamente. Las temperaturas extremas del mes en Baguio fueron 26.2° C., 11.4° C. en la cumbre del Mirador, y 26.9° C., 10.9° C. en el valle.

**Precipitación acuosa.**—La cantidad total de lluvia observada este mes en Filipinas es, sin ninguna excepción, mayor que la del año pasado, aunque es generalmente menor que la normal de noviembre en la parte septentrional de Luzón. La lluvia mensual de Manila difiere de la de noviembre de 1918, en +126.7 mm., y de la normal de este mes en +10.3 mm., al paso que la de Baguio es mayor que la del año pasado en 52.1 mm., y menor que la normal en 23.1 mm. Máximas cantidades de lluvia diarias mayores de 100 mm. se observaron en varias estaciones del SE de Luzón y de las Visayas orientales durante el tifón del 16 al 17 de este mes.

## DEPRESIONES Y TIFONES.

Un solo tifón hubo en Filipinas durante este mes. Se formó probablemente el día 10 al W de Yap, Carolinas Occidentales, y se movió al WNW hasta el 13 en que se inclinó más al W. Desde el 14 el tifón siguió una trayectoria tan anormal cual casi nunca se observa en Filipinas. Esta trayectoria, según se echa de ver en la Lámina IX, está fundada en muchas observaciones de confianza que no dejan apenas duda alguna sobre su exactitud. Consideramos tan importante, sobre todo para los capitanes de barcos, saber que un tifón puede, absolutamente hablando, no sólo inclinarse al SW, sino también recurrir al S y aun al E, y luego seguir de nuevo su curso normal dirigiéndose al W y NW, como sucedió en este caso, que hemos decidido estudiar este tifón más en detalle en un folleto separado o en el apéndice anual de estos boletines mensuales. De ahí el que por ahora nos limitemos a decir que este tifón, después de tres recorridas muy pronunciadas que tuvieron lugar cerca de la Isla de Batag los días 15 y 16, se movió hacia el NW el 17 a lo largo de la costa occidental del SE de Luzón, y luego el 18 tomó una dirección al WSW a través de Mindoro y del Mar de China. Considerable daño causó el temporal en el N de Sámar, SE de Luzón, en Marinduque y Mindoro.

Los dos vapores *San Nicolás* y *Laensamud* se encontraron cerca del centro de este tifón: el primero en la bahía de Masagasai en la parte oriental de Marinduque, y el último en la parte sur del Mar de China. Los interesantes *reports* de observaciones hechas a bordo de los dos citados barcos se publicarán más tarde.

El día 19 apareció una depresión en las Carolinas Occidentales, al S de Guam. Se movió al NW, hallándose su centro el día 20 a la mitad de camino entre Guam y Yap, dando ambas estaciones casi las mismas lecturas barométricas. Parece que la depresión recurvió al NE el 22, pero la falta de observaciones nos impide dar como cierta esta última parte de la trayectoria de este tifón.

Del 28 al 30 hubo indicios de otra depresión, probablemente de poca importancia, moviéndose hacia el W, al NW de Borneo y S de Indochina.

\* All the mean values given in this table are deduced from 6 daily observations taken at 2, 6, 10 a. m. and 2, 6, 10 p. m.

† The barometric readings of this station are not reduced to sea level.

‡ Maximum of hourly observations taken from 6 a. m. to 6 p. m.

§ This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

## SEISMOLOGICAL BULLETIN FOR NOVEMBER, 1919.

By Rev. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

3, 13<sup>h</sup> 18<sup>m</sup> [3, 21<sup>h</sup> 18<sup>m</sup>]. Irosin (SE Luzon). Earthquake shocks on intensity III-IV, long duration: volcanic character, origin in the Bulusan Volcano.

3, 14<sup>h</sup> 44<sup>m</sup> 00<sup>s\*</sup> [3, 22<sup>h</sup> 44<sup>m</sup> 00<sup>s</sup>]. NE Mindanao. Extensive earthquake of intensity IV, felt through northeastern Mindanao and very lightly in Samar Island. Its origin seems to have been in the Philippine Deep of the Pacific near to the parallel 10° N. The seismograph at Butuan recorded only one aftershock at 15<sup>h</sup> 57<sup>m</sup> [23<sup>h</sup> 57<sup>m</sup>].

4, 11<sup>h</sup> 32<sup>m</sup> [4, 19<sup>h</sup> 32<sup>m</sup>]. Cape Bojeador (NW Luzon). Earthquake of intensity III-IV, short duration.

4, 13<sup>h</sup> 32<sup>m</sup> 16<sup>s\*</sup> [4, 21<sup>h</sup> 32<sup>m</sup> 16<sup>s</sup>]. Davao (SE Mindanao). Earthquake of intensity III, felt in southern and eastern Mindanao. This shock was recored by all the seismographs of the Far East; the epicenter probably was in the eastern part of the Celebes Sea.

6, 16<sup>h</sup> 44<sup>m</sup> 28<sup>s\*</sup> [7, 0<sup>h</sup> 44<sup>m</sup> 28<sup>s</sup>]. NW Luzon. Earthquake of intensity VI-VII, felt in many provinces of northern Luzon: its origin was not far from the NW end of this Island in the China Sea. It was recorded at Taihoku (Formosa) and Osaka (Japan). To this principal shock followed as series of seven aftershocks of varying intensity noticeable only in a small area of the NW end of Luzon. The shock felt at Cape Bojeador on the 4th may be considered as a foreshock. The aftershocks occurred on the 6th at 18<sup>h</sup> 11<sup>m</sup>, 20<sup>h</sup> 30<sup>m</sup>; on the 7th, at 3<sup>h</sup> 36<sup>m</sup>, 9<sup>h</sup> 17<sup>m</sup>, 17<sup>h</sup> 15<sup>m</sup>; on the 11th at 10<sup>h</sup> 04<sup>m</sup> and on the 21st at 6<sup>h</sup> 29<sup>m</sup>. As none of them was recorded neither at Manila nor at Taihoku, they must have been very local. In an article published in the Monthly Bulletin for May, 1909, about "Seismic Submarine Centers in Northern Luzon" the writer expressed the opinion that there existed in the sea a seismic center of volcanic character not far from the NW end of Luzon. The seismic period of November 1919 seems to confirm that assertion.

10, 15<sup>h</sup> 45<sup>m</sup> [10, 23<sup>h</sup> 45<sup>m</sup>]. Camp Keithley (N Mindanao). Oscillatory earthquake, intensity IV, duration 8 seconds. Two minutes later a subsultory shock was noticed. These shocks were the first of a series of four seismic disturbances of similar character

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismograph at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (midnight=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

felt in the same station at 17<sup>h</sup> 38<sup>m</sup> and 18<sup>h</sup> 36<sup>m</sup> of the 10th and at 5<sup>h</sup> 29<sup>m</sup> of the 11th. The constant SE-NW direction of the seismic waves given by an experienced observer and their small extension induce to locate the origin in the region of Makaturing and Ragan volcanoes distant some 48 kilometers to the SE of Camp Keithley.<sup>1</sup> These disturbances were recorded at Butuan at a distance of some 180 kilometers.

11, 20<sup>h</sup> 21<sup>m</sup> [12, 4<sup>h</sup> 21<sup>m</sup>]. NE Mindanao. Earthquake of intensity V-VI felt in the Surigao district and in the northern portion of the Agusan Valley. It was not recorded in Manila and its extension did not correspond to the intensity showed at Surigao and Butuan, these two facts induce to believe that the epicenter lay within the Peninsula or to the W or WSW very near in the sea. The rumblings which at Surigao preceded the shocks apparently came from the W. A seismic center of volcanic or rockfall character has been repeatedly indicated by the writer as existing within this region of Mindanao. The seismograph at Butuan recorded but two aftershocks, during the 12th.

16, 3<sup>h</sup> 08<sup>m</sup> 24<sup>s\*</sup> [16, 11<sup>h</sup> 08<sup>m</sup> 24<sup>s</sup>]. E Mindanao. Earthquake felt with intensity III in the eastern portion of Mindanao. The origin seems to have been in the Pacific E or SE of the Island. Recorded at Batavia.

17, 22<sup>h</sup> 39<sup>m</sup> [18, 6<sup>h</sup> 39<sup>m</sup>]. Vigan (NW Luzon). Earthquake shock of intensity III, short duration.

18, 4<sup>h</sup> 03<sup>m</sup> 41<sup>s\*</sup> [18, 12<sup>h</sup> 03<sup>m</sup> 41<sup>s</sup>]. Butuan (N Mindanao). Distant earthquake very lightly felt. It was recorded throughout the globe, the records of Manila and Batavia place the epicenter in the Moluccas group not far from Seroea Island.

27, 7<sup>h</sup> 30<sup>m</sup> [27, 15<sup>h</sup> 30<sup>m</sup>]. Fort Pikit (SW Mindanao). Earthquake shock of intensity III.

---

<sup>1</sup> See Monthly Bulletin, December, 1916, "Volcanic Notes."

## RECORDS OF THE MICROSEISMOGRAPH.

[Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N$ :  $T_0=6.25$ ,  $\epsilon=2.906$ ,  $\frac{r}{T_0^2}=0.058$ ;  $A_E$ :  $T_0=6.18$ ,  $\epsilon=2.393$ ,  $\frac{r}{T_0^2}=0.042$ . Alluvium. 2.40 meters above sea level.]

TEMBOLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

3, 13<sup>h</sup> 18<sup>m</sup> [3, 21<sup>h</sup> 18<sup>m</sup>]. Irosin (SE de Luzón). Temblor de tierra de intensidad III-IV, larga duración, carácter volcánico, origen en el vecino volcán Bulusan.

3, 14<sup>h</sup> 44<sup>m</sup> 00<sup>s\*</sup> [3, 22<sup>h</sup> 44<sup>m</sup> 00<sup>s</sup>]. NE de Mindanao. Temblor de tierra de intensidad IV, sentido en toda la región NE de Mindanao y muy débilmente en la isla de Sámar. Su origen parece se hallaba en el grande Abismo del Pacífico cerca del paralelo 10° N. El sismógrafo de Butúan registró un aftershock procedente del mismo origen a 15° 57<sup>m</sup> [23<sup>h</sup> 57<sup>m</sup>].

4, 11<sup>h</sup> 32<sup>m</sup> [4, 19<sup>h</sup> 32<sup>m</sup>]. Cabo Bojeador (NW de Luzón). Temblor de tierra, de intensidad III-IV, duración muy corta.

4, 13<sup>h</sup> 32<sup>m</sup> 16<sup>s\*</sup> [4, 21<sup>h</sup> 32<sup>m</sup> 16<sup>s</sup>]. Dávao (SE de Mindanao). Temblor de tierra de intensidad III, sentido en gran parte del sur y este de Mindanao, duración corta: este temblor, registrado en todo el Extremo Oriente, parece se originó hacia el E del Mar de Célebes.

6, 16<sup>h</sup> 44<sup>m</sup> 28<sup>s\*</sup> [7, 0<sup>h</sup> 44<sup>m</sup> 28<sup>s</sup>]. NW de Luzón. Temblor de tierra de intensidad VI-VII sentido en gran parte del norte de Luzón: su origen se hallaba cerca del extremo NW de la isla, en el Mar de la China. Registróse también en Taihoku (Formosa) y Osaka (Japón). A este temblor siguió una serie de siete réplicas de variable intensidad sentidas tan solo en una pequeña región del extremo NW. El del 4 sentido en Cabo Bojeador debe considerarse como un temblor preliminar. Las réplicas tuvieron lugar a 18<sup>h</sup> 11<sup>m</sup>, 20<sup>h</sup> 30<sup>m</sup> del 6, a 3<sup>h</sup> 36<sup>m</sup>, 9<sup>h</sup> 17<sup>m</sup>, 17<sup>h</sup> 15<sup>m</sup> del 7, a 10<sup>h</sup> 04<sup>m</sup> del 11 y a 6<sup>h</sup> 29<sup>m</sup> del 21. El no haberse registrado ninguna de dichas réplicas ni en Manila ni en Formosa indica su carácter muy local. En 1909 en un artículo publicado en el Boletín del Observatorio del mes de mayo, titulado "Centros Sísmicos Submarinos cercanos a las costas N de Luzón" señalabamos uno de carácter volcánico cerca del extremo NW de la isla, cuya existencia parece confirmar el período sísmico de este año de 1919.

10, 15<sup>h</sup> 45<sup>m</sup> [10, 23<sup>h</sup> 45<sup>m</sup>]. Camp Keithley (N de Mindanao). Temblor oscilatorio de intensidad IV, duración 8 segundos, seguido dos minutos después de una sacudida súltiora. Este temblor fué el primero de una serie de cuatro temblores de igual carácter sentidos en la misma estación a 17<sup>h</sup> 38<sup>m</sup> y 18<sup>h</sup> 36<sup>m</sup> del propio día 10 y a 5<sup>h</sup> 29<sup>m</sup> del 11. La constante dirección SE-NW que pone el observador y el carácter local de estos temblores hace sospechar fueran de origen volcánico. Es muy posible que su origen estuviera en la región de los volcanes Makaturing y Ragan situada al SE de Camp Keithley a unos 48 kilómetros de distancia.<sup>1</sup> Solamente los registró el sismógrafo de Butúan distante 180 kilómetros.

11, 20<sup>h</sup> 21<sup>m</sup> [12, 4<sup>h</sup> 21<sup>m</sup>]. NE de Mindanao. Temblor de tierra de intensidad V-VI, sentido en todo el distrito de Surigao y en la parte N del Valle del Agusan. No se registró en Manila ni tuvo una extensión proporcional a la intensidad desarrollada en Surigao y en Butúan; esto hace sospechar que el epicentro se hallaba dentro de la misma península de Surigao o en el mar al W u WSW y que era de carácter volcánico. En

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

<sup>1</sup> Véase en el Boletín de diciembre, 1916, "Notas Volcánicas."

Surigao le precedieron ruídos subterráneos procedentes al parecer del W. Dentro de la expresada región se ha señalado en varias ocasiones un centro sísmico superficial de carácter volcánico o de hundimiento. El sismógrafo de Butúan solo registró después durante el día 12 dos réplicas.

16, 3<sup>h</sup> 08<sup>m</sup> 24<sup>s\*</sup> [16, 11<sup>h</sup> 08<sup>m</sup> 24<sup>s</sup>]. **E de Mindanao.** Temblor de tierra sentido con intensidad III en la parte más oriental de Mindanao. Originado seguramente en el Pacífico hacia el E o SE de dicha isla. Registróse también en Batavia.

17, 22<sup>h</sup> 39<sup>m</sup> [18, 6<sup>h</sup> 39<sup>m</sup>]. **Vigan (NW de Luzón).** Temblor de tierra de intensidad III, duración corta.

18, 4<sup>h</sup> 03<sup>m</sup> 41<sup>s\*</sup> [18, 12<sup>h</sup> 03<sup>m</sup> 41<sup>s</sup>]. **Butúan (N de Mindanao).** Temblor de tierra apenas perceptible pero registrado por el sismógrafo como terremoto lejano de mucha intensidad. Registróse en todo el Globo; los registros de Manila y Batavia colocan el epicentro en las Molucas hacia la Isla de Seroea.

27, 7<sup>h</sup> 30<sup>m</sup> [27, 15<sup>h</sup> 30<sup>m</sup>]. **Fort Pikit (SW de Mindanao).** Temblor de tierra de intensidad III.

## METEOROLOGICAL BULLETIN FOR DECEMBER, 1919.

By REV. JOSÉ CORONAS, S. J.,  
*Chief, Meteorological Division of the Weather Bureau..*

### GENERAL WEATHER NOTES.

**Pressure and temperature.**—The mean atmospheric pressure for this month is very slightly above the normal, although it is slightly below the monthly mean of December, 1918. The highest pressures of the month were generally observed on the 21st, 30th, and 31st, and the lowest on the 4th and 5th, when a depression was crossing the Visayan Islands.

The mean monthly temperature is almost identical with that of the preceding year and with the December's normal. The absolute maximum and minimum temperatures for Manila were 32.5° C., observed on the 7th and 8th, and 18.5° C., registered on the 31st. The extreme temperatures for Baguio were 25.0° C., 10.2° C. on the top of Miarod, and 25.7° C., 10.2° C. in the valley.

<sup>a</sup> The barometric readings of this station are not reduced to sea level.

**Rainfall.**—The total amount of rainfall for this month is, with few exceptions, below the normal of December in our stations of Luzon; but it is above the same normal in the majority of our stations of the Visayas and Mindanao. The monthly rainfalls for Manila and Baguio differ from the normal of this month by -35.8 mm. and -23.0 mm., respectively.

## DEPRESSIONS AND TYPHOONS.

There was only one tropical depression during this month in the Far East. Its track was given in Plate IX, bulletin for November, together with the tracks of the depressions and typhoons for the preceding month. This depression was formed on December 1 to the WSW of Yap near 135° longitude E and 7° or 8° latitude N. It moved W by N toward the Visayas, and passed on the 4th very close to the north of Cebu and to the south of Iloilo and San Jose de Buenavista. It seems that after traversing the northernmost part of Palawan Island, it inclined to WSW in the China Sea, until it probably filled up on the 9th near 110° longitude E and 9° latitude N.

## NOTAS GENERALES DEL TIEMPO.

**Presión y temperatura.**—La presión atmosférica media de este mes es muy ligeramente mayor que la normal, aunque es algo menor que la media mensual de diciembre de 1918. Las presiones más altas del mes se observaron generalmente los días 21, 30 y 31, y las más bajas los días 4 y 5 al tiempo en que una depresión cruzaba las Islas Visayas.

La temperatura media mensual es casi idéntica a la del año pasado y a la normal de diciembre. Las temperaturas máxima y mínima absolutas de Manila fueron 32.5° C., observada los días 7 y 8, y 18.5° C., registrada el 31. Las temperaturas extremas de Baguio fueron 25.0° C., 10.2° C. en la cumbre del Mirador, y 25.7° C., 10.2° C. en el valle.

**Precipitación acuosa.**—La cantidad total de lluvia de este mes es, salvo raras excepciones, menor que la normal de diciembre en nuestras estaciones de Luzón; pero es mayor que la misma normal en la mayoría de nuestras estaciones de Visayas y Mindanao. Las lluvias del mes de Manila y de Baguio difieren de la normal de diciembre en —35.8 mm. y —23.0 mm., respectivamente.

## DEPRESIONES Y TIFONES.

Durante este mes sólo hubo una depresión tropical en el Extremo Oriente. Su trayectoria puede verse en la Lámina IX del boletín de noviembre último, juntamente con las trayectorias de las depresiones y tifones del citado mes. Esta depresión se formó el 1 de diciembre al WSW de Yap, Carolinas Occidentales, cerca de 135° longitud E y 7° u 8° latitud N. Se movió al W  $\frac{1}{4}$  NW en dirección a Visayas, y pasó el día 4 muy cerca por el N de Cebú y por el S de Iloílo y San José de Buenavista. Parece que después de haber atravesado el extremo más septentrional de la Isla de Palawan, se inclinó al WSW en el Mar de China, hasta que probablemente se deshizo el día 9 cerca de 110° longitud E y 9° latitud N.

\* All the mean values given in this table are deduced from six daily observations taken at 2, 6, 10 a. m. and 2, 6, 10 p. m.

<sup>b</sup> The barometric readings of this station are not reduced to sea level.

<sup>c</sup> Maximum of hourly observations taken from 6 a. m. to 6 p. m.

<sup>d</sup> This element is based on hourly observations taken from a quadruple register, which gives only eight possible directions of the wind.

\* 3 hours missing.

## SEISMOLOGICAL BULLETIN FOR DECEMBER, 1919.

By REV. MIGUEL SADERRA MASÓ, S. J.,  
*Chief, Seismic and Magnetic Divisions, Weather Bureau.*

### EARTHQUAKES FELT IN THE PHILIPPINES.<sup>1</sup>

3, 12<sup>h</sup> 30<sup>m</sup> [3, 20<sup>h</sup> 30<sup>m</sup>]. Camp Kalaw (E Mindanao). Earthquake shock of intensity III.

3, 14<sup>h</sup> 24<sup>m</sup> 20<sup>s\*</sup> [3, 22<sup>h</sup> 24<sup>m</sup> 20<sup>s</sup>]. Naga (SE Luzon). Oscillatory earthquake, direction E-W, intensity III, duration 8 seconds.

4, 19<sup>h</sup> 06<sup>m</sup> [5, 3<sup>h</sup> 06<sup>m</sup>]. Murcia (W Negros). Earthquake of intensity III.

6, 8<sup>h</sup> 41<sup>m</sup> [6, 16<sup>h</sup> 41<sup>m</sup>]. SE Luzon. Earthquake shocks of intensity III-IV felt in the Provinces of Albay and Sorsogon. Probably of shallow or volcanic origin.

15, 16<sup>h</sup> 49<sup>m</sup> 30<sup>s\*</sup> [16, 0<sup>h</sup> 49<sup>m</sup> 30<sup>s</sup>]. SE Mindanao. Earthquake of intensity IV-V felt in the Province of Davao. It was recorded at Manila, Butuan, and Batavia: the origin seems to have been towards the eastern part of Celebes Sea.

16, 0<sup>h</sup> 49<sup>m</sup> 32<sup>s\*</sup> [16, 8<sup>h</sup> 49<sup>m</sup> 32<sup>s</sup>]. Candon (NW Luzon). Earthquake of intensity III, short duration.

23, 1<sup>h</sup> 19<sup>m</sup> [23, 9<sup>h</sup> 19<sup>m</sup>]. Irosin (SE Luzon). Local shock of intensity III-IV. It repeated at 15<sup>h</sup> 43<sup>m</sup> [23<sup>h</sup> 43<sup>m</sup>] with the same intensity and character. Probably originated in adjoining Bulusan Volcano, active since October, 1918.

23, 15<sup>h</sup> 29<sup>m</sup> 27<sup>s\*</sup> [23, 23<sup>h</sup> 29<sup>m</sup> 27<sup>s</sup>]. E Mindanao. Earthquake of distant origin in the Pacific, lightly felt through eastern Mindanao. Recorded also at Batavia.

23, 22<sup>h</sup> 33<sup>m</sup> [24, 6<sup>h</sup> 33<sup>m</sup>]. Legaspi (SE Luzon). Local shock of intensity III, short duration.

24, 6<sup>h</sup> 00<sup>m</sup> [24, 14<sup>h</sup> 00<sup>m</sup>]. Camp Keithley (N Mindanao). Oscillatory earthquake of intensity III, duration 5 seconds.

28, 7<sup>h</sup> 52<sup>m</sup> 39<sup>s\*</sup> [28, 15<sup>h</sup> 52<sup>m</sup> 39<sup>s</sup>]. SW Luzon. Earthquake lightly felt in the western portion of the Cavite Province and originated in the China Sea, some 160 kilometers from Manila.

29, 4<sup>h</sup> 10<sup>m</sup> [29, 12<sup>h</sup> 10<sup>m</sup>]. E Mindanao. Earthquake of intensity IV, felt chiefly in the central and southern portion of the Agusan Valley, and eastwards in the neighboring Pacific coast. Its origin very likely lay within the island. The seismograph at Butuan recorded an aftershock at 4<sup>h</sup> 41<sup>m</sup> [12 41<sup>m</sup>].

30, 1<sup>h</sup> 55<sup>m</sup> 05<sup>s\*</sup> [30, 9<sup>h</sup> 55<sup>m</sup> 05<sup>s</sup>]. N Luzon. Earthquake of intensity VI-VII in the northernmost provinces, Ilocos Norte, Apayao and Cagayan: it must have been felt with the same or greater intensity in Babuyanes. The records of Manila place the epicenter near to this group of islands.<sup>2</sup>

<sup>1</sup> The intensity of earthquakes is given in the notation known as the Rossi-Forel scale. The time is that indicated by the seismograph at the Central Observatory whenever the disturbance has been registered by them. This fact is denoted by an asterisk (\*). Otherwise the time is that noted by the observer who sent the report. All time indications are in Greenwich mean time (mid-night=0<sup>h</sup>), insular time being added in brackets for the convenience of Philippine readers.

<sup>2</sup> See "Bulletin for November, 1919."

## RECORDS OF THE MICROSEISMOGRAPH.

(Time: Greenwich mean. Midnight=0<sup>h</sup>. Instrument: Wiechert seismograph; 1,000 kilograms.  $A_N: T_0=6.25$ ,  $\epsilon=2.906$ ,  $\frac{r}{T_0^2}=0.053$ ;  $A_E: T_0=6.18$ ,  $\epsilon=2.393$ ,  $\frac{r}{T_0^2}=0.042$ . Alluvium. 2.40 meters above sea level).

TEMBOLORES DE TIERRA SENTIDOS EN FILIPINAS.<sup>1</sup>

3, 12<sup>h</sup> 30<sup>m</sup> [3, 20<sup>h</sup> 30<sup>m</sup>]. Camp Kalaw (E de Mindanao). Temblor de tierra de intensidad III.

3, 14<sup>h</sup> 24<sup>m</sup> 20<sup>s\*</sup> [3, 22<sup>h</sup> 24<sup>m</sup> 20<sup>s</sup>]. Naga (SE de Luzón). Temblor oscilatorio, dirección E-W, intensidad III, duración 8 segundos.

4, 19<sup>h</sup> 06<sup>m</sup> [5, 3<sup>h</sup> 06<sup>m</sup>]. Murcia (W de Negros). Temblor de tierra de intensidad III.

6, 8<sup>h</sup> 41<sup>m</sup> [6, 16<sup>h</sup> 41<sup>m</sup>]. SE de Luzón. Temblor de tierra de intensidad III-IV sentido en las provincias de Albay y Sorsogón. Su origen parece fué superficial o volcánico.

15, 16<sup>h</sup> 49<sup>m</sup> 30<sup>s\*</sup> [16, 0<sup>h</sup> 49<sup>m</sup> 30<sup>s</sup>]. SE de Mindanao. Temblor de tierra de intensidad IV-V, sentido en la provincia de Dávao. Registróse en Manila, Butúan y Batavia; su origen al parecer se hallaba al E del Mar de Célebes.

16, 0<sup>h</sup> 49<sup>m</sup> 32<sup>s\*</sup> [16, 8<sup>h</sup> 49<sup>m</sup> 32<sup>s</sup>]. Candón (NW de Luzón). Temblor de tierra de intensidad III, duración muy corta.

23, 1<sup>h</sup> 19<sup>m</sup> [23, 9<sup>h</sup> 19<sup>m</sup>]. Irosin (SE de Luzón). Temblor local de intensidad III-IV. Repetió a 15<sup>h</sup> 43<sup>m</sup> [23<sup>h</sup> 43<sup>m</sup>] con la misma intensidad y carácter. Su origen probablemente se hallaba en el vecino volcán Bulusan en actividad desde Octubre de 1918.

23, 15<sup>h</sup> 29<sup>m</sup> 27<sup>s\*</sup> [23, 23<sup>h</sup> 29<sup>m</sup> 27<sup>s</sup>]. E de Mindanao. Temblor de tierra de origen algo lejano en el Pacífico, sentido débilmente al E de Mindanáo. Registrado en Batavia.

23, 22<sup>h</sup> 33<sup>m</sup> [24, 6<sup>h</sup> 33<sup>m</sup>]. Legaspi (SE de Luzón). Temblor local de intensidad III, duración corta.

24, 6<sup>h</sup> 00<sup>m</sup> [24, 14<sup>h</sup> 00<sup>m</sup>]. Camp Keithley (N de Mindanao). Temblor oscilatorio de intensidad III, duración 5 segundos.

28, 7<sup>h</sup> 52<sup>m</sup> 39<sup>s\*</sup> [28, 15<sup>h</sup> 52<sup>m</sup> 39<sup>s</sup>]. SW de Luzón. Temblor de tierra sentido débilmente en la parte occidental de la provincia de Cavite; originado en el Mar de la China, a unos 160 kilómetros de distancia de Manila.

29, 4<sup>h</sup> 10<sup>m</sup> [29, 12<sup>h</sup> 10<sup>m</sup>]. E de Mindanao. Temblor de tierra de intensidad IV sentido principalmente en la parte central y meridional del Valle del Agusan y hacia al E en las vecinas costas del Pacífico. El origen parece haber sido insular. El sismógrafo de Butúan registró una réplica a 4<sup>h</sup> 41<sup>m</sup> [12<sup>h</sup> 41<sup>m</sup>].

30, 1<sup>h</sup> 55<sup>m</sup> 05<sup>s\*</sup> [30, 9<sup>h</sup> 55<sup>m</sup> 05<sup>s</sup>]. N de Luzón. Temblor de tierra de intensidad VI-VII en las provincias más septentrionales, Ilocos Norte, Apayaо y Cagayán: debió sentirse con igual o mayor intensidad en las Babuyanes. Los registros de Manila colocan el epicentro cerca de este grupo de islas.<sup>2</sup>

<sup>1</sup> La intensidad de los terremotos se indica conforme a la conocida escala de Rossi-Forel. Cuanto a la hora de su ocurrencia, adoptamos la indicada por los sismógrafos de este Observatorio siempre que los hayan registrado, distinguiéndola por medio de un asterisco (\*). En caso contrario copiamos la apuntada por los observadores que nos envían las notas. Todas las indicaciones del tiempo se refieren al tiempo medio de Greenwich (medianoche=0<sup>h</sup>). Para conveniencia de los lectores de Filipinas se añade también el tiempo insular.

CATALOGUE OF PHILIPPINE EARTHQUAKES, 1919.<sup>a</sup>

Date.	Time of occurrence. (Greenwich mean time.)	Place.	Probable origin or epicenter.		Approximate extension of the shaken area.		Intensity (Rosi-Forel.)	Remarks.
			$\phi$	$\lambda$	Longer axis.	Shorter axis.		
Jan. 1	1 36	E Mindanao -----	°	°	Km. 850	Km. 600	VII	Registered over the world. Four aftershocks, intensity III-IV.
1	6 08	E Mindanao -----	8.0 N	127.0 E	-----	-----	V	Many light aftershocks.
2	22 27	Butuan (N Mindanao) -----	8.0 N	127.0 E	-----	-----	III	Probable origin in the Pacific.
4	2 35	NE Mindanao -----	-----	-----	-----	-----	IV	Probable origin in the Pacific.
5	14 20	Davao (SE Mindanao) -----	-----	-----	-----	-----	III	Aftershock at 14 <sup>h</sup> 20 <sup>m</sup> , intensity III-IV.
9	0 10	Ambos Camarines (SE Luzon) -----	-----	-----	-----	-----	III	Origin in the Isarog volcanic region.
13	12 01	Davao (SE Mindanao) -----	-----	-----	-----	-----	IV	Repetition at 20 <sup>h</sup> 06 <sup>m</sup> , intensity III. Probably rockfall origin.
15	7 30	Davao (SE Mindanao) -----	-----	-----	-----	-----	III	-----
15	18 28	Iloilo (SE Panay) -----	-----	-----	-----	-----	III	-----
25	11 22	Butuan (N Mindanao) -----	-----	-----	-----	-----	IV	-----
29	18 48	Ormoc (W Leyte) -----	10.7 N	124.5 E	-----	-----	VI	-----
30	11 23	Butuan (N (Mindanao) -----	-----	-----	-----	-----	III	-----
Feb. 1	7 46	Ormoc (W Leyte) -----	-----	-----	-----	-----	III	-----
3	19 26	Guam (Mariana Islands) -----	-----	-----	-----	-----	IV	-----
4	13 06	Cape Bojeador (NW Luzon) -----	-----	-----	-----	-----	IV-V	-----
8	13 28	Vigan (NW Luzon) -----	-----	-----	-----	-----	III	-----
8	16 04	Ormoc (W Leyte) -----	10.7 N	124.5 E	-----	-----	V	-----
13	22 05	E Visayas and Mindanao -----	11.0 N	127.0 E	800	500	III-IV	Repetition, intensity III on the 9th.
15	10 45	Camiguin Island (N of Mindanao) -----	-----	-----	-----	-----	III	Recorded at Butuan.
17	3 42	E Mindanao -----	-----	-----	-----	-----	III	Origin far off in the Pacific.
18	21 05	Guam (Mariana Islands) -----	-----	-----	-----	-----	III-IV	Probable origin in the Pacific, Philippine Deep.
22	17 12	Butuan (N Mindanao) -----	-----	-----	-----	-----	III	Repeated one hour later. Local origin.
24	21 26	Butuan (N Mindanao) -----	-----	-----	-----	-----	III	Origin in the Pacific.
Mar. 3	2 37	E Mindanao -----	-----	-----	-----	-----	III	Origin in the Pacific.
6	7 23	E Mindanao -----	-----	-----	-----	-----	III	Origin in the Pacific.
7	1 12	S Mindanao -----	-----	-----	-----	-----	III-IV	Origin in the Celebes Sea. Several aftershocks.
7	12 56	Catbalogan (W Samar) -----	-----	-----	-----	-----	III	-----
8	11 00	Antique (W Panay) -----	-----	-----	-----	-----	III	-----
11	4 48	Cotabato (SW Mindanao) -----	-----	-----	-----	-----	III	-----
11	8 33	Camiguin Island (N of Mindanao) -----	-----	-----	-----	-----	III-IV	-----
15	14 08	N Luzon -----	18.8 N 6.5 N	121.0 E 127.0 E	300	200	IV	-----
16	7 35	E Mindanao and Visayas -----	-----	-----	700	400	V	Repeated with the same intensity at 15 <sup>h</sup> 05 <sup>m</sup> , numerous aftershocks during the three following days. Registered over the world.
21	1 03	SE Luzon and Visayas -----	13.6 N	121.9 E	700	500	VII-VIII	-----
21	17 23	E Mindanao and Visayas -----	-----	-----	600	300	IV	-----
22	1 40	Legaspi (SE Luzon) -----	-----	-----	-----	-----	III	-----
23	22 53	E Mindanao and Visayas -----	11.7 N	126.4 E	600	300	IV-V	Recorded in the Far East.
25	14 23	Cotabato (SW Mindanao) -----	-----	-----	-----	-----	III	-----
25	18 45	Antique (W Panay) -----	-----	-----	-----	-----	III	-----
29	2 23	Atimonan (E Luzon) -----	-----	-----	-----	-----	III	-----
Apr. 3	2 52	Ambos Camarines (SE Luzon) -----	-----	-----	-----	-----	III	Aftershock at 6 <sup>h</sup> 07 <sup>m</sup> . Volcanic origin.
8	15 59	Butuan (N Mindanao) -----	-----	-----	-----	-----	III-IV	Origin in the Pacific, Philippine Deep. Registered at Manila.
12	12 14	Paracale (SE Luzon) -----	-----	-----	-----	-----	III	Recorded at Manila.
16	16 42	E Mindanao -----	-----	-----	500	200	V	Origin probably in the Pacific. Registered in the Far East.
21	13 49	Ambos Camarines (SE Luzon) -----	-----	-----	-----	-----	V	-----
23	17 20	Catbalogan (W Samar) -----	-----	-----	500	350	III	-----
27	0 23	Tablas Island -----	-----	-----	-----	-----	VII-VIII	-----
28	1 57	Baguio (W Luzon) -----	-----	-----	-----	-----	III	Numerous aftershocks to May the 1st. Registered over the world.

<sup>a</sup> See explanation in Monthly Bulletin of the Weather Bureau for December, 1910, page 445.

	0 20	Baguio (W Luzon)					IV	
	6 00	Port Lebak (SW Mindanao)					IV	
	11 11	Cape Bojeador (NW Luzon)					III-II V	Aftershock at 13 <sup>h</sup> 40 <sup>m</sup> . Registered at Manila and Batavia.
June 4	17 52	W Mindanao	7.0 N	123.0 E	400	400	V-VI	Registered at Manila and Batavia.
	8 55	SE Luzon, Samar and Leyte	12.6 N	125.2 E	600	300	IV	Registered at Manila.
	17 30	Ambos Camarines (SE Luzon)					III	Origin in the Isarog volcanic region.
	20 51	Butuan (N Mindanao)	7.0 N	123.0 E	400	400	III	Registered at Manila and Batavia.
	14 37	W Mindanao					V	Some other shocks were felt on the 19th, 28th, and 30th.
	07 15	Tablas Island					IV	Probable origin in the China Sea. Registered at Manila. Aftershock at 22 <sup>h</sup> 50 <sup>m</sup> .
	4 47	N Luzon	17.3 N	120.5 E	350	200	IV	
	13 25	Aparri (NE Luzon)					IV	
	11 06	Leyte Island					III	Origin SE of Masbate. Registered at Manila.
	7 30	Ormoc (W Leyte)					III-IV	
July 2	16 18	W Luzon	16.4 N	119.5 E			IV	Registered at Manila.
	18 35	N Luzon	17.3 N	120.5 E	300	250	VI-VII	Registered over the world. Strong aftershocks at 19 <sup>h</sup> 37 <sup>m</sup> , 19 <sup>h</sup> 53 <sup>m</sup> , 21 <sup>h</sup> 08 <sup>m</sup> and 23 <sup>h</sup> 19 <sup>m</sup> .
	19 36	Zamboanga (W Mindanao)					III	
	21 24	Panay and Negros Islands	10.3 N	122.5 E			III-IV	Registered at Manila.
	22 39	Butuan (N Mindanao)					III	Registered at Manila. Origin far off in the Pacific.
	9 30	Candon (NW Luzon)					II-III	
	1 38	Panay and Negros Islands	10.3 N	122.5 E			III-IV	Registered at Manila.
	18 55	Maasin (S Leyte)					III	Probable origin in the Celebes Sea. Repetition at 7 <sup>h</sup> 30 <sup>m</sup> .
	2 45	Port Lebak (SW Mindanao)					IV-V	Aftershock at 7 <sup>h</sup> 00 <sup>m</sup> .
	6 14	Surigao (NE Mindanao)	9.5 N	125.2 E			III	
Aug. 2	19 11	Camp Keithley (N Mindanao)					III	
	12 00	San Joaquin (S Panay)					IV	Aftershocks at 13 <sup>h</sup> 30 <sup>m</sup> and 15 <sup>h</sup> 35 <sup>m</sup> . Registered at Manila.
	12 02	Panay and Negros Islands	10.3 N	122.5 E			III-IV	
	17 00	Tablas Island					III	
	22 48	Guian (SE Samar)					III-IV	
	11 37	Cape Bojeador (NW Luzon)					III	
	4 48	Butuan (N Mindanao)					III	
	7 25	Tablas Island					III-IV	
	20 00	Camp Keithley (N Mindanao)					III	
	19 38	Ambos Camarines (SE Luzon)					III-IV	Origin in the Isarog volcanic region.
Aug. 4	23 19	Camp Keithley (N Mindanao)					IV	
	6 56	Butuan (N Mindanao)					III	Local origin.
	9 31	Tigaon (SE Luzon)					III	Aftershock at 9 <sup>h</sup> 50 <sup>m</sup> . Volcanic origin.
	2 00	Cape Bojeador (NW Luzon)					III	
	5 38	S Mindanao			300	300	V-VI	Origin Celebes Sea. Recorded at Manila and Batavia.
	18 00	Davao (SE Mindanao)					IV-V	Origin E Celebes Sea. Registered at Manila and Batavia.
	8 04	Central Mindanao					V-VI	Volcanic origin.
	4 02	Davao (SE Mindanao)					III	Insular origin.
	8 00	Tablas Island			400	250	VI-VII	Four preliminary shocks, intensity IV-V, at 22 <sup>h</sup> 08 <sup>m</sup> , 22 <sup>h</sup> 28 <sup>m</sup> , on the 13 <sup>th</sup> and 5 <sup>h</sup> 11 <sup>m</sup> on the 14 <sup>th</sup> . Two aftershocks at 15 <sup>h</sup> 00 <sup>m</sup> and 15 <sup>h</sup> 58 <sup>m</sup> . Registered at Manila.
	20 22	Surigao (NE Mindanao)					III	Origin, Butuan Bay.
Sept. 7	4 15	Borongan (E Samar)					III	
	14 22	N Luzon	18.8 N	121.0 E	300	200	V-VI	Registered at Manila and Taihoku. Aftershock some minutes latter.
	4 04	Ormoc (W Leyte)					IV	
	5 25	Davao (SE Mindanao)					III	
	11 50	Isabela (W Negros)					III	
	5 49	Guam (Mariana Islands)					III	Registered over the world.
	23 21	Surigao (NE Mindanao)					III-IV	Origin, Butuan Bay.
	4 40	Paracale (SE Luzon)					III	Origin in the Pacific. Registered at Manila.
	5 55	Cape Bojeador (NW Luzon)					III	
	11 22	Cape Bojeador (NW Luzon)					III	
14	3 25	Antique (W Panay)					III	
	9 46	W Luzon			400	150	III-IV	Origin in the China Sea. Aftershock at 10 <sup>h</sup> 05 <sup>m</sup> .

*Catalogue of Philippine earthquakes, 1919.—Continued.*

Date.	Time of occurrence. (Greenwich mean time.)	Place.	Probable origin or epicenter.		Approximate extension of the shaken area.		Intensity (Rossi-Forel.)	Remarks.
			$\phi$	$\lambda$	Longer axis.	Shorter axis.		
Sept. 21	4 04	Davao (SE Mindanao)	○	○	Km.	Km.	IV	Origin, Davao Gulf. Registered at Manila and Batavia.
	23 50	Veruela (E Mindanao)			250	100	III	Origin S Agusan Valley.
	18 47	W Luzon			500	350	III-IV	Origin in the China Sea.
	9 08	NW Luzon	17.3 N	120.5 E			VII	Numerous aftershocks. Registered over the world.
	19 42	W Mindanao	6.3 N	123.2 E	500	400	VI	Seventeen shocks of varying intensity during the interval of eleven hours. Registered over the world.
	6 00	NW Luzon	17.3 N	120.5 E			III-IV	Seven moderate shocks between 6 <sup>h</sup> and 14 <sup>h</sup> .
Oct.	19 17	Cape Bojeador (NW Luzon)					II-III	
	13 55	Candon (NW Luzon)					III	
	1 08	Butuan (N Mindanao)					III	Recorded at Butuan.
	2 18	Port Lebak (SW Mindanao)					III	
	8 24	Candon NW Luzon					III	
	5 58	Port Lebak (SW Mindanao)					III	Registered at Butuan.
	5 11	SE Luzon, Masbate and Samar	18.0 N 4.5 N	124.5 E 125.8 E	550 400	300 300	IV	Registered at Manila.
	5 38	Central Mindanao					V	Registered at Manila and Batavia.
	19 22	Surigao (NE Mindanao)					III	
	21 30	Candon (NW Luzon)					II-III	
Nov.	5 07	Yap (Western Carolines)					III	
	11 20	Port Lebak (SW Mindanao)					III	
	13 18	Irosin (SE Luzon)	10.0 N	127.0 E	400	100	III-IV	Volcanic origin.
	14 44	NE Mindanao					IV	Aftershock at 15 <sup>h</sup> 57 <sup>m</sup> .
	11 32	Cape Bojeador (NW Luzon)					III-IV	
Dec.	13 32	Davao (SE Mindanao)					III	
	16 44	NW Luzon	18.7 N	120.6 E			VI-VII	Origin, E of Celebes Sea. Registered in the Far East.
	15 45	Camp Keithley (N Mindanao)	7.6 N	124.5 E			IV	Rockfall character. Registered at Manila, Taihoku, and Osaka. Several aftershocks on the 6th, 7th, and 11th.
	20 21	NE Mindanao	9.2 N	125.4 E	250	150	V-VI	Repetitions at 17 <sup>h</sup> 38 <sup>m</sup> and 18 <sup>h</sup> 36 <sup>m</sup> , and at 5 <sup>h</sup> 29 <sup>m</sup> on the 11th.
	3 08	E Mindanao					III	Volcanic character.
	22 39	Vigan (NW Luzon)					III	Origin far off in the Pacific. Registered at Manila and Batavia.
	4 04	Butuan (N Mindanao)					II	Origin in the Molucas. Registered over the world.
	7 30	Fort Pikit (SW Mindanao)					III	
	12 30	Camp Kalaw (E Mindanao)					III	Insular origin, S of Agusan Valley.
	14 24	Naga (SE Luzon)					III	Probably volcanic origin.
Dec.	19 06	Murcia (W Negros)					III	Volcanic origin.
	8 41	SE Luzon			150	100	III-IV	Origin, E of Celebes Sea. Registered at Manila and Batavia.
	16 49	SE Mindanao					IV-V	
	0 50	Candon (NW Luzon)					III	Repetition intensity III-IV at 15 <sup>h</sup> 43 <sup>m</sup> . Volcanic origin.
	1 19	Irosin (SE Luzon)					III-IV	Registered at Manila and Batavia.
	15 29	E Mindanao					III	
	22 33	Legaspi (SE Luzon)					III	
	6 00	Camp Keithley (N Mindanao)					III	
Dec.	7 53	SW Luzon					III	Origin in the China Sea. Registered at Manila.
	4 10	E Mindanao	18.8 N	121.0 E	200	200	IV	Origin S of Agusan Valley.
	1 55	N Luzon					VI-VII	Registered at Manila.
